Part One:
Introduction
Before You Start

This course guide accompanies the Level 1 training sessions. Level 1 shows you how to produce 3-D models using NURBS geometry.

In class, you will receive information at an accelerated pace. For best results, practice at a Rhino workstation between class sessions, and consult your Rhino reference manual and the Help file for additional information.

**Duration:**

3 days

**Course Objectives**

In Level 1, you learn how to:

- Utilize the features of the Rhino user interface
- Customize your modeling environment
- Create basic graphic objects—lines, circles, arcs, curves, solids, and surfaces
- Model with precision using coordinate input and object snaps
- Modify curves and surfaces with edit commands
- Use control point editing to modify curves and surfaces
- Analyze your model
- Display any portion of the model
- Export and import models to and from different file formats
- Render the model

The Rhino for Windows Interface

Rhino uses NURBS for all curve and surface geometry.
Rhino Basics

The Rhino for Windows Interface

Before learning individual tools, we will get acquainted with the Rhino interface. The following exercises examine the interface elements used in Rhino: the Rhino window, viewports, menus, toolbars, and dialog boxes.

There are many ways to access the commands in Rhino—the keyboard, menus, and toolbars. We will focus on the toolbars in this class.

To open Rhino:

- Double-click the Rhino icon from the Windows desktop.
The Rhino Screen

Rhino divides its window into six areas that supply information or prompt you for input.

<table>
<thead>
<tr>
<th>Screen Area</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Menu Bar</td>
<td>Access commands, options, and help.</td>
</tr>
<tr>
<td>Command area</td>
<td>Lists prompts, commands you enter, and information displayed by the command.</td>
</tr>
<tr>
<td>Toolbars</td>
<td>Access shortcuts to commands and options.</td>
</tr>
<tr>
<td>Graphics area</td>
<td>Displays the open model. Several viewports can be displayed. The default viewport layout displays four viewports (Top, Front, Right, Perspective).</td>
</tr>
<tr>
<td>Viewports</td>
<td>Displays different views of the model within the graphics area.</td>
</tr>
<tr>
<td>Status bar</td>
<td>Displays the coordinates of the pointer, the status of the model, options, and toggles.</td>
</tr>
</tbody>
</table>

Watch the command line to find out what is happening.
Menus

Most of the Rhino commands can be found in the menus.

Toolbars

Rhino toolbars contain buttons that provide shortcuts to commands. You can float a toolbar anywhere on the screen, or dock it at the edge of the graphics area.

Rhino starts up with the Standard toolbar docked above the graphics area and the Main1 and Main2 toolbars docked on the left.
**Tooltips**

Tooltips tell what each button does. Move your pointer over a button without clicking it. A small yellow tag with the name of the command appears. In Rhino, many buttons can execute two commands. The tooltip indicates which buttons have dual functions.

**Flyouts**

A button on a toolbar may include other command buttons in a flyout toolbar. Usually the flyout toolbar contains variations on the base command. After you select a button on the flyout, the flyout disappears.

Buttons with flyouts are marked with a small white triangle in the lower right corner. To open the flyout toolbar, hold down the left button for a moment or press both buttons at the same time.

The Lines toolbar is linked to the Main1 toolbar.

If you hold the left mouse down over the Line button of the Main1 toolbar, the flyout Lines toolbar opens.

**Graphics Area**

The Rhino graphics area holding the viewports can be customized to suit your preferences. The position of viewports can be arranged in different configurations.
Viewports

Viewports are windows in the display area that show you views of your model. To move and resize viewports, drag the viewport title or borders. You can create new viewports, rename viewports, and use predefined viewport configurations. Each viewport has its own construction plane that the cursor moves on and a projection mode.

To toggle between a small viewport and one that fills the graphics area, double-click the viewport title.

Rearranged Rhino screen. Command line at the bottom, single maximized viewport, and toolbars docked in different locations.
Command Area

The command area displays commands and command prompts. It can be docked at the top or the bottom of the screen or it can float anywhere. The command window shows three lines by default. To open a window that displays the command history, press F2. The text in the Command History window can be selected and copied to the Windows clipboard.

The Mouse

In a Rhino viewport, the left mouse button selects objects and picks locations. The right mouse button has several functions including panning and zooming, popping up a context-sensitive menu, and acting the same as pressing the Enter key. Use the left mouse button to select objects in the model, commands or options on the menus, and buttons in the toolbars. Use the right mouse button to complete a command, to move between stages of commands, and to repeat the previous command. The right mouse button is used to initiate commands from some toolbar buttons.

Drag with the right mouse button to pan and rotate in viewports. Use the mouse wheel or hold down the Ctrl key and drag with the right mouse button to zoom in and out in a viewport. You must press and hold the right mouse button down to activate this feature.

Entering Commands

Use the command line to type commands, pick command options, type coordinates, type distances, angles, or radii, type shortcuts, and view command prompts.

To enter information typed at the command line, press Enter, Spacebar, or right mouse button over a viewport.

Note: Enter and Spacebar perform the same function.

Shortcuts are customizable key combinations. You can program the function keys and Ctrl key combinations to perform Rhino commands.

Clickable options

To use command options, click the option on the command line or type the underlined letter of the option and press Enter. (The interior capitalization is meaningless.)
**Autocomplete command name**

Type the first few letters of a command name to activate the autocomplete command list. When enough letters of the command are typed so that it is unique, the command name completes on the command line. Press Enter to activate the command once the full command name appears. As you type command names, the autocomplete command list appears. As you type more letters, the list is narrowed down to the possible commands. Left click on the command in the list to start it.

**Repeating commands**

To repeat the last command, right-click in a viewport, or press Enter or spacebar. To repeat previous commands, right-click in the command line window and select from a list.

**Canceling commands**

To cancel a command, press Esc or enter a new command from a button or a menu.

**Help**

Press F1 at any time to access Rhino Help. In addition to finding information about each command, Rhino help has conceptual information as well as many examples and graphics to help you complete your model. When you are stalled for any reason, the first place you should look is the help file. You can also access help for a specific command by starting the command and then press F1.
View the Command Line History

The command line history window lists the last 500 command lines from the current Rhino session. Press F2 to view the command history.

View Recent Commands

Right-click the command line to view recently used commands. To repeat the command, select it from the popup menu.
**Exercise 1—Rhino basics**

1. From the **File** menu, click **Open**.
2. In the **Open** dialog box, select **First Model.3dm**.

You will find this model in the Training folder. If you haven’t copied the files to your hard drive from the Training folder on the Rhino CD, you should do this before you proceed.

Two parallel viewports and one perspective viewport.

This model contains five objects: a cube, a cone, a cylinder, a sphere, and a rectangular plane.

You will not be able to select or move the plane. You will learn about how to do this later. It is just there to provide you with a floor underneath the objects.
3 From the **View** menu, click **Viewport Layout**, then click **4 Viewports**.

![Viewport Layout](image)

*Three parallel viewports and one perspective viewport*

4 In the **Status Bar**, click **Snap** to turn on the grid snap.

Grid snap may already be on in your system. Be careful that you do not turn it off instead of on. If grid snap is on, the word “Snap” will be black in the status bar. If it is off, the word “Snap” will be gray.

**Note:** This is an important step. Grid snap only lets your cursor move in certain intervals. In this model, by default grid snap is set to one half of a grid line. Grid snap helps you line up your objects as if you were building with LEGO® blocks.

5 Click the mouse in the **Perspective** viewport to make it active.

The viewport title highlights when it is active. The active viewport is the viewport where all your commands and actions take place.
6 Click with the **Right Mouse Button** (RMB) on the **Perspective** viewport title, then click **Shaded Display**.

The objects appear shaded. Shaded display lets you preview the shapes. The viewport will remain shaded until you change it back to a wireframe view. You can change any viewport to shaded mode. Later we will discuss the other shaded display options.
7 From the **Render** menu, click **Render**.

Rendering the model opens a separate render window. The model displays in render colors previously assigned to the objects. You can also set lights and a background color. You will learn about doing this later. You cannot manipulate the view in the render display window but the image can be saved to a file.

8 Close the render window.

9 In the **Perspective** viewport, click and drag with your right mouse button held down to rotate the view.

The plane helps you stay oriented. If the objects disappear, you are looking at the bottom of the plane.

10 Right click on the **Perspective** viewport title, then click **Ghosted Display**.

---

**Notes:**

Render
11 Right click on the **Perspective** viewport title, then click **X-ray Display**.

12 Right click on the **Perspective** viewport title, then click **Rendered Display**.

13 Change to a **Wireframe Display** mode.

14 To rotate your view, drag from the bottom of the view toward the top.

*Looking at the objects from the bottom in wireframe mode.*
You are now under the objects looking up.
15 Change to a **Shaded Display** mode.

The plane obscures the objects.

![Perspective view with Shaded Display](image)

*Looking at the objects from the bottom in shaded mode.*

In shaded mode, the plane helps you see when your viewpoint is below the objects.

**To get back to your original view:**

- Press the **Home** key to undo your view changes.

**If you are “lost in space” in the perspective view:**

- From the **View** menu, click **Viewport Layout**, and then click **4 Viewports**.
  
  This takes you back to the default viewport settings.

**Navigating Around the Model**

You have used the right mouse button to rotate in the **Perspective** viewport. You can hold **Shift** and drag with the right mouse button to pan. Dragging the right mouse button to move around does not interrupt any commands in progress.

**To pan in a viewport:**

1. In the **Top** viewport, hold **Shift** and drag with the right mouse button to pan the view.

   ![Top viewport with Shift](image)

   *Panning with Shift and the right mouse button.*

2. **Pan** the view in the other viewports.

**Notes:**

*What if …*

Instead of panning or rotating, something funny happened.

*If you right-click quickly once in viewport, the last command starts again. You must hold the right mouse button down while panning or rotating.*
Zooming in and out
Sometimes you want to get closer to your objects or move back so you can see more. This is called **zooming**. As with many things in Rhino, there are several ways to do this. The easiest way is to hold down the **Ctrl** key and drag up and down in a viewport with the right mouse button. If you have a mouse with a scroll button, turn the mouse wheel to zoom in and out.

**To zoom in and out:**
- In the **Top** viewport, hold the **Ctrl** key, click and hold the right mouse button, and drag the mouse up and down.
  - Drag up to zoom in.
  - Drag down to zoom out.

*Zooming with ctrl and the right mouse button.*

Zooming extents
The Zoom Extents command zooms a viewport so the objects fill up the viewport as much as possible. You can use this command to make everything visible.

**To zoom extents in a viewport:**
- From the **View** menu, click **Zoom**, and then click **Extents**.
  - If you get lost, it is often handy to zoom extents in all your viewports at once, so there is a command to do just that.

**To zoom extents in all viewports:**
- From the **View** menu, click **Zoom**, and then click **Extents All**.
Move Objects

Dragging follows the construction plane of the current viewport.

Now drag the objects around. You can drag in any viewport. In this model, Snap is set to one-half of a grid line. Using this snap, you should be able to line objects up with each other.

**To move objects:**

1. Click the cone and drag it.
   
   The cone highlights to show it is selected.

   ![The selected cone highlights.](image)

   *The selected cone highlights.*

2. Drag the cone in the **Perspective** viewport until it lines up with the cylinder.
   
   It will be inside the cylinder.

   The cone moves on the base that is represented by the grid. This base is called a *construction plane*. Each viewport has its own construction plane. When you start Rhino, the **Perspective** viewport has the same construction plane as the **Top** viewport. You will learn more about using construction planes later.

   ![Drag the cone to move it.](image)

   *Drag the cone to move it.*
3 In the **Front** viewport, drag the cone to the top of the cylinder.
   Watch what happens in the **Perspective** viewport.
   There are many times when you have to watch what is happening in other viewports to accurately
   place your objects.

   ![Image of Front viewport](image1.png)

   *Move the cone in the Front viewport.*

4 Click in the **Perspective** viewport.

5 Change the viewport to a **Rendered Display**.

   ![Image of Perspective viewport](image2.png)

   *Rendered Display.*

**Try on Your Own**

1 Re-open the model. Do not save changes.

2 Drag the objects around.
   - Use the **Front** viewport to move the objects vertically and the **Top** or **Perspective** viewport to
     move them horizontally.
Copy Objects

To create more objects, copy the shapes.

To start with a new model:
1. From the File menu, click Open.
2. Do not save the changes.
3. In the Open dialog box, select First Model.3dm.

To copy objects:
1. Click the box to select it.
2. From the Transform menu, click Copy.
3. At the Point to copy from (Vertical=No InPlace) prompt, click somewhere in the Top viewport.
   It usually helps to click a spot that relates to the object like the middle.

4. At the Point to copy to prompt, click where you want the first copy.
   Zoom in closer if you like.
5. At the next Point to copy to prompts, click other places to make more copies of the box.

Select and copy the box.

Make three copies
6 When you have enough copies, press **Enter**.

**Try on Your Own**
- Make copies of more objects and move them around. See if you can build something.

**Changing the View of Your Model**

When you add detail to your models, you will need to see different parts of your model with different magnifications. You can use the view commands, the mouse, and the keyboard to change the view in a viewport.

Each view corresponds to the view through a camera lens. The invisible target of the camera is located in the middle of the viewport.

**Viewports**

With Rhino, you can open an unlimited number of viewports. Each viewport has its own projection, view, construction plane, and grid. If a command is active, a viewport becomes active when you move the mouse over it. If a command is not active, you must click in the viewport to activate it.

**Parallel vs. Perspective Projection**

Unlike other modelers, Rhino lets you work in both parallel and perspective views.

**To toggle a viewport between parallel and perspective view:**

1. Right-click the viewport title, click **Viewport Properties**.
2. In the **Viewport Properties** dialog box, click **Parallel** or **Perspective**, and then click **OK**.
Panning and Zooming
The simplest way to change the view is to hold down the **Shift** key and drag the mouse with right mouse button held down. This pans the view. To zoom in and out, hold down the **Ctrl** key and drag up and down or use the mouse wheel.

You can also use the keyboard to move around:

<table>
<thead>
<tr>
<th>Key</th>
<th>Action</th>
<th>+ Ctrl</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left Arrow</td>
<td>Rotate left</td>
<td>Pan left</td>
</tr>
<tr>
<td>Right Arrow</td>
<td>Rotate right</td>
<td>Pan right</td>
</tr>
<tr>
<td>Up Arrow</td>
<td>Rotate up</td>
<td>Pan up</td>
</tr>
<tr>
<td>Down Arrow</td>
<td>Rotate down</td>
<td>Pan down</td>
</tr>
<tr>
<td>Page Up</td>
<td>Zoom in</td>
<td></td>
</tr>
<tr>
<td>Page Down</td>
<td>Zoom out</td>
<td></td>
</tr>
<tr>
<td>Home</td>
<td>Zoom previous</td>
<td></td>
</tr>
<tr>
<td>End</td>
<td>Zoom next</td>
<td></td>
</tr>
</tbody>
</table>

You can change your view in the middle of a command to see precisely where you want to select an object or select a point.

Resetting Your View
If you get lost, four view techniques can help you get back to a starting place.

**To undo and redo view changes:**
- Click in a viewport, then press your Home or End key on your keyboard to undo and redo view changes.

**To set your view so you are looking straight down on the construction plane:**
- From the View menu, click Set View, and then click Plan.

**To bring all your objects into view:**
- From the View menu, click Zoom, and then click Zoom Extents.

**To bring all your objects into view in all viewports:**
- From the View menu, click Zoom, and then click Extents All.
Exercise 2—Display options

- Open the model **Camera.3dm**.

You will use this to practice changing views. You will create views from six directions including the oblique perspective view.
To change the number of viewports:
1. Make the Top viewport active.
2. From the View menu, click Viewport Layout, and then click Split Vertical.
3. Repeat this step for the other parallel views.
4. Right click on the Top viewport title on the left, click Set View, then click Bottom.
5. Right click on the Front viewport title on the left, click Set View, then click Left.
6. Right click on the Right viewport title on the right, click Set View, then click Back.
7. From the View menu, click Zoom, and then click Extents All.

To synchronize the viewports:
1. Right click on the Front viewport title, click Zoom, and then click Synchronize Views.

All the views are sized to the same scale as the active viewport and aligned with each other.
To change the shape of viewports:

1. Move your cursor to the edge of a viewport until you see the resizing resizing cursor, hold the left mouse button down, and drag the bar. If two viewports share the edge, both resize.

2. Move your cursor to the corner of a viewport until you see the resizing resizing cursor, hold the left mouse, and drag the intersection in any direction. If several viewports touch at that corner, all resize.

To zoom to a window:

1. From the View menu, click Zoom, and then click Window.

2. At the Drag a window to zoom (All Dynamic Extents Factor In Out Selected Target) prompt, drag a window around a portion of the model.

To zoom a selected object:

1. Select the shutter release.

2. From the View menu, click Zoom, and then click Selected. The view zooms to the selected object.

To rotate the view:

- In a perspective viewport, drag with right mouse button.
- In a parallel viewport, use the arrow keys.
To maximize and restore a viewport:

1. Double-click the viewport title to maximize it.
2. Double-click the title of the maximized viewport to restore it to its smaller size and reveal the other viewports.
Creating Two-Dimensional Objects

Drawing Lines

The **Line**, **Lines**, and **Polyline** commands draw straight lines. The **Line** command draws a single line segment. The **Lines** command draws multiple end-to-end line segments. The **Polyline** command draws a series of straight segments joined together (a single linear curve with multiple segments).

**Exercise 3—Drawing lines**

1. From the **File** menu, click **New**. Do not save changes.
2. In the **Template File** dialog box, click **Millimeters.3dm**.
3. From the **File** menu, click **Save As**.
4. In the **Save As** dialog box, type **Lines**, and then click **Save**.

**To draw line segments:**

1. From the **Curve** menu, click **Lines**, and then click **Line Segments** to begin the **Lines** command.
2. At the **Start of line** prompt, pick a point in a viewport.
3. At the **End of line** ( **Undo** ) prompt pick another point in a viewport. A line segment appears between the two points.
4. At the **End of line. Press Enter when done** ( **Undo** ) prompt, pick another point. You can press the right button instead of pressing the **Enter** key on your keyboard to terminate the command.
To use the Close option:
1. From the Curve menu, click Lines, and then click Line Segments to begin the Lines command.
2. At the Start of line prompt, pick a point.
3. At the End of line ( Undo ) prompt pick another point.
4. At the End of line. ... ( Undo ) prompt, pick another point.
5. At the End of line. ... ( Close Undo ) prompt, click Close.
The last line will end at the original start point.

To draw a polyline:
1. From the Curve menu, click Lines, and then click Polyline to begin the Polyline command.
2. At the Start of polyline prompt, pick a point.
3. At the Next point of polyline ( Undo ) prompt pick another point.
4. At the Next point of polyline. ... ( Undo ) prompt, pick another point.
5. At the Next point of polyline. ... ( Close Undo ) prompt, continue to pick points.

To use the Undo option:
1. From the Curve menu, click Lines, and then click Polyline to begin the Polyline command.
2. At the Start of polyline prompt, pick a point.
3. At the Next point of polyline ( Undo ) prompt pick another point.
4. At the Next point of polyline. ... ( Undo ) prompt, pick another point.
5. At the Next point of polyline. ... ( Close Undo ) prompt, click Undo.
One segment of the polyline is removed.
6 At the **Next point of polyline.** ...( Undo ) prompt, pick another point.
7 At the **Next point of polyline.** ... ( Close Undo ) prompt, press **Enter** to end the command.

**To draw a single line segment:**
1 From the **Curve** menu, click **Lines**, and then click **Single Line** to begin the **Line** command.
2 At the **Start of line** ( Normal Angled Vertical FourPoint Bisector Perpendicular Tangent Extend BothSides ) prompt, pick a point.
3 At the **End of line** ( BothSides ) prompt, pick another point.
   The command ends after one segment is drawn.

**To use the BothSides option:**
1 From the **Curve** menu, click **Lines**, and then click **Single Line** to begin the **Line** command.
2 At the **Start of line** ( Normal Angled Vertical FourPoint Bisector Perpendicular Tangent Extend BothSides ) prompt, click **BothSides**.
3 At the **Middle of line** (Normal Angled Vertical FourPoint Bisector Perpendicular Tangent Extend ) prompt, pick a point.
4 At the **End of line** prompt, pick another point.
   A segment is drawn with equal length on both sides of the start point.
Drawing Free-form Curves

The **InterpCrv** and **Curve** commands draw free-form curves. The **InterpCrv** command draws a curve through the points you pick. The **Curve** command uses control points to create a curve.

**Exercise 4—Drawing interpolated curves**

1. From the **Curve** menu, click **Free-form**, and then click **Interpolate Points**.
2. At the **Start of curve** (Degree=3 Knots=SqrtChord StartTangent ) prompt, pick a point.
3. At the **Next point of curve** (Degree=3 Knots=SqrtChord EndTangent Undo ) prompt, pick another point.
4. At the next several **Next point of curve** (Degree=3 Knots=SqrtChord EndTangent Close Sharp=No Undo ) prompts, pick more points.
   Or, click an option, and press **Enter**.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Close</td>
<td>Closes the shape by drawing a segment from the last point picked to the first point picked. This ends the command.</td>
</tr>
<tr>
<td>EndTangent</td>
<td>After choosing a point on another curve, the next segment will be tangent to the point you picked and end the command.</td>
</tr>
<tr>
<td>Undo</td>
<td>Deletes the last point picked.</td>
</tr>
<tr>
<td>Degree</td>
<td>You can set the degree of the curve.</td>
</tr>
<tr>
<td>Knots</td>
<td>Determines how the interpolated curve is parameterized. When you draw an interpolated curve, the points you pick are converted into knot values on the curve. The parameterization means how the intervals between knots are chosen:</td>
</tr>
<tr>
<td>Sharp</td>
<td>When you make a closed curve, it will come to a point instead of making a smooth closure as it normally does.</td>
</tr>
</tbody>
</table>

**Exercise 5—Drawing curves from control points**

1. From the **Curve** menu, click **Free-form**, and then click **Control Points**.
2. At the **Start of curve** (Degree=3 ) prompt, pick a point.
3. At the **Next point** (Degree=3Undo ) prompt, pick another point.
4. At the **Next point** (Degree=3 Close Sharp=No Undo ) prompts, pick more points.
   Or, click an option, and press **Enter**.

Notice that most of the points you pick are off the curve as control points.
Modeling Aids

Modes are modeling aids that you can toggle on or off by pressing shortcut keys, a function key, typing a single letter command, or clicking a button.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Function Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ortho</td>
<td>F8 or Shift</td>
<td>Ortho on restricts cursor movement to the points at a specified angle from the last point created. The default angle is 90 degrees. Pressing and holding the Shift key down toggles Ortho. If Ortho is set to on, hold down the Shift key to toggle Ortho off. If Ortho is off, hold down the Shift key to toggle Ortho on.</td>
</tr>
<tr>
<td>Grid</td>
<td>F7</td>
<td>Hides or shows a reference grid in the current viewport of the graphics screen at the construction plane.</td>
</tr>
<tr>
<td>Snap</td>
<td>F9 or S</td>
<td>Forces the marker to snap on grid intersections.</td>
</tr>
<tr>
<td>Planar</td>
<td>P</td>
<td>This is a modeling aid similar to Ortho. This helps you model planar objects by forcing input to be on a plane parallel to the construction plane that passes through the last point that you picked.</td>
</tr>
</tbody>
</table>

Click the **Snap**, **Ortho**, and **Planar** panes on the status bar to toggle these modeling aids on and off.

**Exercise 6—Drawing lines and curves using mode functions**

1. **Toggle Snap** on and draw some lines.
   The marker snaps to each grid intersection.

2. **Toggle Snap** off, **toggle Ortho** on and draw some lines and curves.
   You can only input points that are at 90 degree intervals from the last point. Using Snap and Ortho toggles you can draw with precision. We will discuss other ways to get precision in a later session.
Model Setup

In Rhino you can create full-size models using precise measurements. You might need to change the modeling environment depending on the type of model you are creating; the default options may not always work.

To change the options:

1. From the **File** menu, click **Properties**.
2. In the **Document Properties** dialog box, under **Rhino Options**, click **Modeling Aids**. **Modeling Aids** lets you control **Ortho, Object Snap, Grid Snap**, and other mode options.

3. Change the **Ortho** option to snap every **30** degrees.
4 In the **Document Properties** dialog box, click **Grid**.

![Document Properties dialog box]

5 In **Grid** properties, change the following settings.

You can change the appearance of the modeling environment by changing the grid elements. The grid spacing, the frequency of the major lines, and the number of grid elements can be changed. The Grid dialog box lets you configure grid settings.

6 Change the **Grid Extents** setting to **10**.
7 Change the **Minor grid lines every** setting to **1**.
8 Change the **Major lines every** setting to **4**.
9 Change the **Snap Spacing** setting to **.25**, and click **OK**.
10 Draw some more lines and curves with **Snap** and **Ortho** on.

Notice that the marker now snaps between the grid intersections and that **Ortho** snaps at every 30 degrees.
11 Try to draw the closed polyline below with Snap and Ortho turned on.

12 From the Tools menu, click Options.
13 In the Document Properties dialog box, click Modeling Aids.
14 Change the Ortho options to snap every 90 degrees.

**Saving Your Work**

Save your work periodically during a session to keep it from getting accidentally deleted.

**To save your model:**
- From the File menu, click Save.
  - Or, click one of the other options. You will have an opportunity to save your work.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save</td>
<td>Saves your model and keeps it open.</td>
</tr>
<tr>
<td>SaveSmall</td>
<td>Save your model without render or analysis meshes and preview image to minimize file size.</td>
</tr>
<tr>
<td>IncrementalSave</td>
<td>Save sequentially numbered versions of your model.</td>
</tr>
<tr>
<td>SaveAs</td>
<td>Saves your model to a specified file name, location, and format.</td>
</tr>
<tr>
<td>SaveAsTemplate</td>
<td>Save as a template.</td>
</tr>
</tbody>
</table>

Notes:

It is good practice to save your model in stages under different names, using the Save As command. This lets you go back to an earlier version of your model for modifications if necessary.
Layers

Rhino layers work like CAD layering systems. By creating objects on different layers, you can edit and view related portions of a model separately or as a composite. You can create as many layers as you like.

You can display all layers simultaneously or turn any of them off. You can lock layers so they are displayed but cannot be selected. Each layer has a color. You can assign a name to each layer (for example, Base, Body, Top) to organize the model or you can use preset layer names (Default, Layer 01, Layer 02, Layer 03).

The Layers window manages layers. Use it to set up layers for your model.

Exercise 7—Layers

To create a new layer:

1. From the Edit menu, click Layers, and then click Layers.

   The Default layer is created automatically when you start a new model with no template. If you use a standard Rhino template, a few additional layers are also created.

2. In the Layers window, click New.

3. The new Layer 06 appears in the list, type Line and press Enter.

4. Click New.

5. The new Layer 06 appears in the list, type Curve and press Enter.
To assign a color to a layer:

1. Click the **Color** patch on the **Line** row in the list.

2. In the **Select Color** dialog box, click **Red** from the list.
   - The right half of the sample rectangle turns red.
   - Hue, Sat, Val are the hue, saturation and value components of the color.
   - R, G, and B are the red, green and blue components of the color.

3. Click **OK**.

4. In the **Layers** window, the new color appears in the color bar on the Line row of the layer list.

5. Repeat steps 1–3 to make the **Curve** layer **Blue**.

6. Click **OK** to close the dialog box.

**To make a layer current:**

1. In the **Status Bar**, click the **Layer** pane.

2. In the Layer popup, click **Line**.
   - Clicking the name or the checkbox sets the current layer.

3. Draw some lines.
   - The lines are on the Line layer and they are colored red.

---

**Notes:**

Hue is controlled by moving the line around the circular portion of the color wheel.

Hue is the color that is referred to as a scale ranging from red through yellow, green and blue and then circularly back to red.

Saturation and Value are controlled by moving the small circle around in the square portion in the middle of the color wheel.

Saturation is the vividness of hue. Value is the relative lightness or darkness of a color.
4 To make a different layer current, click the **Layer** pane of the status bar.

5 Click **Curve**.

6 Draw some curves.
   They are on the Curve layer and are colored blue.

7 Draw more lines and curves on each layer.

**To lock a layer:**

1. From the **Edit** menu, click **Layers**, and then click **Layers**.
2. In the **Layers** window, click the **Lock** icon in the row for **Line**, and click **OK**.
   Locking a layer turns it into a reference only layer. You can see and snap to objects on locked layers. You cannot select any objects on locked layers. You cannot make a locked layer current without unlocking it.

**To turn a layer off:**

1. From the **Edit** menu, click **Layers**, and then click **Layers**.
2. In the **Layers** window, click the **On/Off** icon (light bulb) in the row for **Curve**, and click **OK**.
   Turning a layer off makes all objects on it invisible.

**Exercise 8—Selecting objects**

**To select a single object:**

- Move your pointer arrow over the object and left-click.
  The object turns yellow, which is the default highlight color.

**To select more than one object:**

1. Move your pointer arrow over the first object and left-click.
2. While holding the **Shift** key down, move your pointer over another object and left click.
To select more than one object using a window:
1. Move your pointer arrow into an open area to the left of the objects you want to select.
2. Hold your left mouse button down and drag diagonally to the right until you have several objects inside the selection box.
   The window selection box is a solid rectangle.
3. Release your mouse button.
   All objects completely inside the selection box will be selected.
4. To add to your selection set, hold the **Shift** key down while making another selection.

To select more than one object using a crossing window:
1. Move your pointer arrow into an open area to right of the objects you want to select.
   Hold your left mouse button down and drag diagonally to the left until you have several objects inside or touching the box.
   The crossing selection box is a dotted rectangle.
2. Release your mouse button.
   All objects inside or touching the box will be selected.
3. To add to your selection set, hold the **Shift** key down while making another selection.

To hide an object:
1. Select an object.
2. From the **Edit** menu, click **Visibility**, and then click **Hide**.
   The object becomes invisible.

To show hidden objects:
- From the **Edit** menu, click **Visibility**, and then click **Show**.
  The **Show** command redisplays all hidden objects.

To lock an object:
1. Select an object.
2. From the **Edit** menu, click **Visibility**, and then click **Lock**.
   The object becomes shaded gray. You can see the locked object, you can snap to it, but you cannot select it.
To unlock locked objects:

- From the **Edit** menu, click **Visibility**, and then click **Unlock**.
  The **Unlock** command redisplays all locked objects.

To change an object from one layer to another:

1. Select an object.
2. From the **Edit** menu, click **Layers**, and then click **Change Object Layer**.

3. In the **Layer for object** dialog box, select the new layer for the object, and click **OK**.
Deleting Objects
Delete removes selected objects from the model. Use **Delete** to practice selection.

**Exercise 9—Practice using delete and selection options**
1. From the **File** menu, click **Open**.
2. In the **Open** dialog box click **Delete.3dm** and click **Open**, or double-click **Delete.3dm** to open the model.

3. Select the square and the circle.

4. From the **Edit** menu, click **Delete** or press the **Delete** key.
   The objects disappear.

**To start the first practice:**
1. Select one of the lines on the hexagon in the **Top** viewport.
   Because there are several curves superimposed on each other, the selection menu appears, allowing you to select one of the curves.

2. Select the top curve from the list.
3 From the **Edit** menu, click **Delete**.
Observe one disappear in the **Perspective** viewport.

4 In the Top viewport, use a crossing box to select the surface and the polyline in the top right part of the drawing.
Both objects are selected.

5 From the **Edit** menu, click **Delete**.

6 Make a window to select the polyline and the cylinder in the lower right part of the drawing.
Only those objects that are completely inside the window are selected.

7 From the **Edit** menu, click **Delete**.

8 Continue deleting objects in the drawing.
Practice using different selection methods to select and deselect objects. Use crossing and window. The **Shift** key while selecting will let you add to your selection set. The **Ctrl** key while selecting will let you to remove objects from your selection set.

To undo deletions:
- From the **Edit** menu, click **Undo**.
  Each time you click, **Undo** takes you back one command.

To redo:
- From the **Edit** menu, click **Redo**.
  Each time you click, the previous **Undo** is reinstated.
So far you have been drawing imprecise lines. Now you will try drawing lines at specific places. To do this you will use *coordinates*.

Whenever you draw a curve, or create a solid primitive, Rhino asks you for a series of points. You can tell that Rhino is asking for point input two ways: the command prompt has a prompt like *Start of line, Start of polyline, Start of curve*, or *Next point* and the arrow-shaped cursor turns into a cross-shaped cursor.

You can enter a point two ways: pick a point in a viewport with the mouse, or type coordinates at the command line.

Rhino uses a fixed Cartesian coordinate system called the world coordinate system (WCS), based on three axes (the x-, y-, and z-axes) that define locations in three-dimensional space.

Each viewport has a construction plane that defines coordinates for that viewport. We will work in the *Top* and *Perspective* viewports where the two coordinate systems are the same.

Notes:

Set the units and tolerance of the model before you begin.

You can change the tolerance after you start, but objects created before the change still have the old tolerance value.
Absolute Coordinates

The first forms of coordinates you will use are called **absolute** coordinates. Absolute coordinates are exact locations relative to the x-, y-, and z-axes.

**Exercise 10—Setting up a model**
1. From the **File** menu, click **New**.
2. Click **Millimeters.3dm**, and then click **Open**.
3. From the **File** menu, click **Save As**.
   - Name the model **BOXES**.
   - Use the **BOXES.3dm** model to learn how to draw with absolute coordinates.

**Exercise 11—Entering absolute coordinates**
1. Double-click the viewport title to maximize the **Top** viewport.
2. From the **Curve** menu, click **Lines**, and then click **Polyline**.
3. At the **Start of polyline** prompt, type **0,0** and press **Enter**.
4. At the **Next point of polyline** (Undo) prompt, type **5,0** and press **Enter**.
5. At the **Next point of polyline**. Press Enter when done (Undo) prompt, type **5,5** and press **Enter**.
6. At the **Next point of polyline**. Press Enter when done (Close Undo) prompt, type **0,5** and press **Enter**.
7. At the **Next point of polyline**. Press Enter when done (Close Undo) prompt, click **Close** to close the polyline.
Relative Coordinates

Absolute coordinates can be slow and cumbersome, but they do work. Most of the time, relative coordinates are easier to use. Every time you select a point, Rhino saves that point as the last point. Relative coordinates are based on the last point entered, instead of on the origin (0,0,0) of the construction plane.

Precede the x,y,z coordinates with a single R to enter relative coordinates.

Exercise 12—Entering relative coordinates

1. From the Curve menu, click Lines, and then click Polyline.
2. At the Start of polyline prompt, type 8,0 and press Enter.
3. At the Next point of polyline ( Undo ) prompt, type R5,0 and press Enter.
   These are absolute coordinates.
4. At the Next point of polyline. Press Enter when done ( Undo ) prompt, type R0,5 and press Enter.
   These are relative coordinates.
5. At the Next point of polyline. Press Enter when done ( Close Undo ) prompt, type R-5,0 and press Enter.
6. At the Next point of polyline. Press Enter when done ( Close Undo ) prompt, click Close to close the polyline.
Polar Coordinates

*Polar coordinates* specify a point that is a distance and direction away from 0,0 in the current construction plane. For example, if you want a point four units away from the construction plane origin, at a 45° angle clockwise from the construction plane x-axis, type `4<45`, and press Enter. Relative polar coordinates are preceded by `R`; absolute polar coordinates are not. Instead of using x-, y-, and z-coordinates, enter relative polar coordinates like this: `Rdistance<angle`.

**Exercise 13—Entering polar coordinates**

1. From the Curve menu, click Lines, and then click Polyline.
2. At the Start of polyline prompt, type `0,8` and press Enter.
3. At the Next point of polyline ( Undo ) prompt, type `R5<0` and press Enter.
4. At the Next point of polyline. Press Enter when done ( Undo ) prompt, type `R5<90` and press Enter.
5. At the Next point of polyline. Press Enter when done ( Close Undo ) prompt, type `R5<180` and press Enter.
6. At the Next point of polyline. Press Enter when done ( Close Undo ) prompt, click Close to close the polyline.
Distance and Angle Constraint Entry

Using distance constraint entry, you can specify a point by typing a distance and pressing Enter. Then as you move your cursor in any direction, the distance from the last point will be constrained. This is a good way to specify a line length quickly.

Using angle constraint entry, you can specify an angle by typing < followed by a value and pressing Enter. The next point is constrained to lines at multiples of the angle relative to the x-axis you specified.

Using the Shift key to toggle Ortho on and off:

When Ortho is off you can hold the Shift key down to toggle it on. This method is an efficient way to draw perpendicular lines. In the following example, draw a line 5 units long using distance constraints.

Exercise 14—Distance constraint entry

1. From the Curve menu, click Lines, and then click Polyline.
2. At the Start of polyline prompt, type 8,8 and press Enter.
3. At the Next point of polyline ( Undo ) prompt, type 5 and press Enter.
4. Hold the Shift key down and pick a point to the right.

Distance constraining value 5

5. At the Next point of polyline. Press Enter when done ( Undo ) prompt, type 5 and press Enter.
6. Hold the Shift key down and pick a point up.

Ortho constrains the cursor to 90 degrees

7. At the Next point of polyline. Press Enter when done ( Close Undo ) prompt, type 5 and press Enter.
8. Hold the Shift key down and pick a point to the left.

Ortho constrains the cursor to 180 degrees.
9 At the **Next point of polyline**. Press Enter when done (Close Undo) prompt, click **Close** to close the polyline.

**Exercise 15—Distance and angle constraint entry**

1. From the **Curve** menu, click **Lines**, and then click **Polyline**.
2. At the **Start of polyline** prompt, type **16,5** and press **Enter**.
3. At the **Next point of polyline** (Undo) prompt, type **5** and press **Enter**, then type `<45` and press **Enter**.
   As you drag your cursor around the marker snaps to a distance of 5 and an angle of 45 degrees.
4. Pick a point down and to the right.
   The angle constraint sets the angle.

   ![Diagram](image)

   **Angle constraint value 30**
5. At the **Next point of polyline**. Press Enter when done (Undo) prompt, type **5** and press **Enter**, then type `<45` and press **Enter**.
6. Pick a point up and to the right.
   The angle constraint sets the angle.
7. At the **Next point of polyline**. Press Enter when done (Close Undo) prompt, type **5** and press **Enter**, then type `<45` and press **Enter**.
8. Pick a point up and to the left.
   The angle constraint sets the angle.
9. At the **Next point of polyline**. Press Enter when done (Close Undo) prompt, click **Close** to close the polyline.
10. Save your model. You will use this model for another exercise.
Exercise 16—Practice using distance and constraint entry

1. Start a new model. Save as Arrow.

2. Draw the arrow with a polyline, using a combination of absolute coordinates (x,y), relative coordinates (Rx,y), polar coordinates (Rdistance<angle), and distance constraint.

   Begin your model at -11,0. The following is an example of the command line input that you might use:

   Next point of polyline ( Undo ): r-2,-2
   Next point of polyline. Press Enter when done ( Undo ): r8,0
   Next point of polyline. Press Enter when done ( Close Undo ): r1,1
   Next point of polyline. Press Enter when done ( Close Undo ): r11<0
   Next point of polyline. Press Enter when done ( Close Undo ): r0,-1
   Next point of polyline. Press Enter when done ( Close Undo ): r6,2
   Next point of polyline. Press Enter when done ( Close Undo ): r-6,2
   Next point of polyline. Press Enter when done ( Close Undo ): r0,-1
   Next point of polyline. Press Enter when done ( Close Undo ): r11<180
   Next point of polyline. Press Enter when done ( Close Undo ): r-1,1
   Next point of polyline. Press Enter when done ( Close Undo ): r8<180
   Next point of polyline. Press Enter when done ( Close Undo ): c

3. Save your model.
To make it 3-D:

1. Select the polyline (1).
2. From the **Surface** menu and click **Revolve**.
3. Toggle **Snap** on.
4. At the **Start of revolve axis** prompt, select the end of the arrow along the centerline (2).
5. At the **End of revolve axis** prompt, select the other end of the arrow (3) along the centerline.
6. In the **Revolve Options** dialog box, click **OK**.

Your arrow is now a three-dimensional model.
Viewports

Viewports are windows in the Rhino graphics area that show you a view of your model. To move and resize viewports, drag the viewport title or borders. The cursor moves along a construction plane, which is defined for each viewport. You can create new viewports, rename viewports, and use predefined viewport configurations. To activate a viewport click anywhere in the viewport and the title highlights. If you are in a command sequence, you simply have to move your cursor into a viewport to activate it.
**Construction planes**

The construction plane is the guide used for modeling Rhino objects. Points you pick are always on the construction plane unless you use coordinate input, elevator mode, or object snaps.

Each construction plane has its own axes, a grid, and an orientation relative to the world coordinate system.

Default construction planes are provided with the default viewports.

- The **Top** construction plane x- and y-axes align with the world x- and y-axes.
- The **Right** construction plane x- and y-axes align with the world y- and z-axes.
- The **Front** construction plane x- and y-axes align with the world x- and z-axes.
- The **Perspective** viewport uses the **Top** construction plane.

Each construction plane has a grid. The grid is a plane of perpendicular lines lying on the construction plane. On default grids, every fifth line is slightly thicker. The red line represents the construction plane x-axis. The green line represents the construction plane y-axis. The red and green lines meet at the construction plane origin.

The red and green axes on the grid are the x- and y-axes of that viewport’s construction plane. The construction plane axes happen to be lined up with world axes when you first start Rhino, so it is confusing in the front and side viewports where the y-axis of the construction plane happens to be pointing up in the world z- direction. The icon in the left hand corner always shows world coordinates, which are different from the construction plane axes.

**Exercise 17—Modeling in 3-D space**

Rhino makes it easy to draw in 3-D space. You can draw on a different construction plane by simply moving your cursor into a different viewport. Another useful tool for modeling in 3-D space is **elevator mode**.

In the following exercise we will draw in different viewports and use elevator mode to move some points in 3-D space.
You will use Snap and Ortho to draw in different viewports.

1. Open the model `Chair.3dm`.
   The model units are centimeters.
2. Toggle Planar and Snap on. Toggle Ortho on as needed.
3. From the Curve menu, click Lines, and then click Polyline.
4. Move your cursor into the Front viewport.
5. At the Start of polyline prompt, type `0,0` and press Enter.
6. At the Next point of polyline prompt, use coordinate input to draw the first part of the chair frame.
   - At the Next point of polyline prompt, move your cursor to the Right viewport to draw a horizontal line.
   - At the Next point of polyline prompt, move your cursor to the Front viewport hold down the Ctrl key, and pick the point at the lower end of the diagonal line.
Holding the Ctrl key while clicking with the left mouse button activates elevator mode.

**Elevator mode** lets you pick points that are off the construction plane. Elevator mode requires two point picks to completely define the point. The first specifies the base point. The second specifies how far the final point is above or below the base point.

After the base point is specified, the marker is constrained to a tracking line perpendicular to the construction plane that passes through the base point.

Pick a second point to specify the coordinate of the desired point. You can pick a point with the mouse, or type a single number to specify the height above the construction plane. Positive numbers are above the construction plane; negative numbers are below.

9 At the **Next point of polyline** prompt, release the Ctrl key, move your cursor to the Right viewport and adjust the point until it lines up with the other part of the chair, and pick.

10 At the **Next point of polyline** prompt, continue drawing the rest of the chair frame.

11 At the **Next point of polyline** prompt, on the next to the last segment you will have to use elevator mode again.
12 At the **Next point of polyline** prompt, click **Close**.

![Diagram](image1.png)

We now want to draw along the chair back, so we will change the construction plane.

**To change the construction plane:**

1. On the **Status Bar**, click **Osnap**, and check **End**.
2. From the **View** menu, click **Set CPlane**, then click **3 Points**.
3. At the **CPlane origin** prompt, move your cursor to the **Perspective** viewport, and pick the vertex (1) at the back of the chair.

![Diagram](image2.png)

4. At the **X axis direction** prompt, pick the vertex (2) at the other side of the back.
5. At the **CPlane orientation** prompt, pick the vertex (3) at the top of the chair.

The construction plane is now aligned with the back of the chair.

![Diagram](image3.png)
6 Draw some lines on the new construction plane.

To make it solid:

1 Select the chair frame.
2 From the Solid menu, click Pipe.
3 At the Radius for closed pipe <1> (Diameter) prompt, type 3 and press Enter.
   The chair has a solid frame.

4 Save the model.

On your own:
Try some variations and add some features.
**Exercise 18—Practice using distance and angle constraints**

1. Start a new model using the **Millimeters** template. Save as **V-Block**.
2. Double-click the viewport title in the **Front** viewport to maximize it.
   Create the following model in the front construction plane.
3. Draw the object below using a combination of absolute coordinates \((x,y)\), relative coordinates \((r\,x,y)\), and relative polar coordinates \((r\,\text{distance}<\text{angle})\).
4. Start your model at **0,0** in the **Front** viewport.
   Try to create the model using a single polyline.
   ![Diagram](image)
5. Double-click the viewport title of the **Front** viewport to restore your views.
6. Select the polyline.
7. From the **Solid** menu, click **Extrude Planar Curve**.
8. At the **Extrusion distance <1>** (Direction Cap=Yes BothSides Tapered) prompt, type **60** and press **Enter**.
   You can view the model as a three-dimensional object in the **Perspective** viewport.
   ![Perspective](image)
9. Save your model.
Object Snaps

Object Snaps are tools for specifying points on existing objects. Use them for precision modeling and to get accurate data. Object snaps are often referred to as osnaps. In Rhino, reliable modeling and easy editing depends on objects actually meeting at specified points. Objects snaps give you precision you cannot get using the “eyeball” method.

To open the Osnap toolbar

- Click the Osnap pane in the status bar.

This toolbar controls persistent object snaps. Use persistent objects snaps to maintain an object snap through choosing several points without having to reactivate the object snap.

When an object snap is active, moving the cursor near an eligible point on an object causes the marker to jump to that point and a tooltip to appear.

Check a box to turn on the object snap. You can place the toolbar anywhere on your desktop.

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>

**Exercise 19—Using object snaps**

1. **Open** the model **Osnaps.3dm**.
2. Toggle **Snap** and **Ortho** off.

**Using End and Midpoint object snaps:**

1. Click the **Osnaps** pane on the status bar.
   - You can leave the **Osnaps** toolbar displayed.
   - **Osnap bar with End and Mid on.**
2. Check **End** and **Mid**.
   - You can check and clear individual object snaps to make modeling with precision easy.
3. From the **Curve** menu, click **Lines**, and then click **Polyline**.
4. At the **Start of polyline** prompt, move your cursor close to the end of the line at the lower left corner of the first square and pick when the marker snaps to the end of the line.
5. Pick points to draw the polyline.
   - The line starts exactly at that corner.
6. At the **Next point of polyline** prompt, snap to the midpoint of the right vertical edge of the second square.
   - The marker snaps to the midpoint of the line that the cursor touches, making the new line cross to the exact midpoint of that side.
7. Pick to draw the polyline.
8. At the **Next point of polyline** prompt, snap to the end at the upper left corner of the first box. The marker snaps to the end of the line.
9. Pick to draw the polyline, and press **Enter**.

**Using Near and Perpendicular to object snaps:**
1. In the **Osnap toolbar** check **Near** and **Perp**, clear **End** and **Mid**.
2. From the **Curve** menu, click **Lines**, and then click **Polyline**.
3. At the **Start of polyline** prompt, pick on the lower edge the circle at the top right. The marker snaps to the point on the circle nearest to where the cursor is positioned.
4. At the **Next point of polyline** prompt, pick the top horizontal edge of the second square. The marker snaps to a point making a perpendicular to the previous point.
5. Pick to draw the polyline, and press **Enter**.

**Using Intersection and Tangent to object snaps:**
1. In the **Osnap toolbar** check **Int** and **Tan**; clear **Near** and **Perp**.
2. From the **Curve** menu, click **Lines**, and then click **Polyline**.
3. At the **Start of polyline** prompt, pick the intersection where the diagonal line crosses the vertical line on the first square. The marker snaps to the intersection between the two lines.
4 At the **Next point of polyline** prompt, pick the top, left edge of the circle on the right. The marker snaps to a point tangent to the circle.
5 Pick to draw the polyline segment, and press **Enter**.

**Using Center of object snap:**
1 In the **Osnap toolbar** check **Cen**, clear **Int** and **Tan**.
2 From the **Curve** menu, click **Lines**, and then click **Polyline**.
3 At the **Start of polyline** prompt, pick on the edge of a circle.
   The marker snaps to the center of the circle.

4 At the **Next point of polyline** prompt, pick on the edge of the other circle. The marker snaps to the center of the circle.
5 Pick to draw the polyline segment, and press **Enter**.

**Using Quadrant of object snap:**
1 In the **Osnap toolbar** check **Quad**, clear **Cen**.
2 From the **Curve** menu, click **Lines**, and then click **Polyline**.
3 At the **Start of polyline** prompt, pick a point on the top edge of the first circle. The marker snaps to the quadrant point of the circle.

4 At the **Next point of polyline** prompt, pick the left edge of the circle. The marker snaps to the quadrant point of the circle.
5 At the **Next point of polyline** prompt, pick the bottom edge of the circle.
6 At the **Next point of polyline** prompt, pick the right edge of the circle.
7 At the **Next point of polyline** prompt, click **Close**.

**Analysis Commands**

Rhino provides analysis tools for finding lengths, angles, areas, distances, and the volume and centroid of solids. Additional commands let you analyze curve curvature, determine continuity between curves, and find unjoined edges.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distance</td>
<td>Displays the distance between two points.</td>
</tr>
<tr>
<td>Length</td>
<td>Displays the length of an object.</td>
</tr>
<tr>
<td>Angle</td>
<td>Displays the angle between two lines.</td>
</tr>
<tr>
<td>Radius</td>
<td>Measures the radius of curvature of a curve, circle, or arc at the point where you pick the curve and displays it on the command line.</td>
</tr>
<tr>
<td>EvaluatePt</td>
<td>The Cartesian coordinates of the point, in both world and construction plane coordinates are displayed on the command line in x,y,z format.</td>
</tr>
</tbody>
</table>

**To find the distance between two points:**

1 From the **Analyze** menu, click **Measure Distance**.
2 At the **First point for distance** prompt, pick the intersection where a diagonal line intersects a vertical line.
3 At the **Second point for distance** prompt, pick the intersection where the other diagonal line intersects the same vertical line.

Use object snaps.
4 Press F2 to display the information.

CPlane angles and deltas:  xy = 90 elevation = 0  dx = 0 dy = 3.077 dz = 0
World angles and deltas:  xy = 90 elevation = 0  dx = 0 dy = 3.077 dz = 0
Distance = 3.077 millimeters

**To find the length of a line:**
1. From the *Analyze* menu, click *Measure Length*.
2. At the *Select Curve to measure* prompt, select the line between the centers of the circles.

![Diagram](image)

Length = 8.000 millimeters

**To measure the angle between two lines:**
1. From the *Analyze* menu, click *Measure Angle*.
2. At the *Start of line* prompt, select a point that defines the start of an angle line.
3. At the *End of first line* prompt, select a point that defines the end of an angle line.
   Use object snaps as appropriate.

![Diagram](image)

4. At the *Start of second line* prompt, select a point that defines the beginning of the second angle line.
5 At the **End of second line** prompt, select a point that defines the end of the second angle line.

![Diagram of angle](image)

The angle displays on the command line in the following format:

Angle is 21.7711 degrees

**To measure the radius of a circle:**

1. From the **Analyze** menu, click **Measure Radius**.
2. At the **Select point on curve for radius measurement** prompt, select one of the circles. This also measures a radius on a curve.

![Diagram of circle and radius](image)

The radius displays on the command line in the following format:

Radius at pick point is 2.5

**To evaluate a point:**

1. From the **Analyze** menu, click **Analyze Point**.
2. At the **Point to evaluate** prompt, snap to the end point of one of the squares.

![Diagram of point](image)
The x,y,z point is displayed for the world coordinate plane and the current construction plane. Point in world coordinates = 8.000,5.000,0  CPlane coordinates = 8.000,5.000,0

**Drawing Circles**

You can create circles using a center point and radius, center point and a diameter, two points on the diameter, three points on the circumference, and tangent points to two coplanar curves and a radius.

<table>
<thead>
<tr>
<th>Button</th>
<th>Command</th>
<th>Description</th>

<tr>
<td><img src="image" alt="Circle" /></td>
<td>Circle 3Point</td>
<td>Draw a circle through three points on its circumference</td>
</tr>
<tr>
<td><img src="image" alt="Circle" /></td>
<td>Circle Diameter</td>
<td>Draw a circle using two diameter points.</td>
</tr>
<tr>
<td><img src="image" alt="Circle" /></td>
<td>Circle Tangent</td>
<td>Draw a circle tangent to two or three curves.</td>
</tr>
<tr>
<td><img src="image" alt="Circle" /></td>
<td>Circle AroundCurve</td>
<td>Draw a circle perpendicular to a curve at the chosen point.</td>
</tr>
</tbody>
</table>

**Circle options**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deformable</td>
<td>Draws an approximation of a circle with a defined number of control points..</td>
</tr>
<tr>
<td>Vertical</td>
<td>Draw a circle perpendicular to the construction plane.</td>
</tr>
</tbody>
</table>

**Exercise 20—Drawing circles**

**To draw a center, radius circle:**

1. From the Curve menu, click Circle.
2. At the Center of circle (Deformable Vertical 2Point 3Point Tangent AroundCurve) prompt, type 20,10 and press Enter.
3. At the Radius <1> (Diameter) prompt, type 3 and press Enter. A circle is created.
To draw a center, diameter circle:
1. From the Curve menu, click Circle.
2. At the Center of circle (Deformable Vertical 2Point 3Point Tangent AroundCurve) prompt, type 20,3 and press Enter.
3. At the Radius <3> (Diameter) prompt, click Diameter.
4. At the Diameter <6.00> (Radius) prompt, type 5 and press Enter.
   A circle is created that is based on a center point and a diameter. The Diameter option will be the default until you change it.

To draw a 3-point circle:
1. From the Curve menu, click Circle.
2. At the Center of circle (Deformable Vertical 2Point 3Point Tangent AroundCurve) prompt, click 3Point.
3. At the First point on circle prompt, snap to an End on one of the squares.
4. At the Second point on circle prompt, snap to another vertex on the same square.
5. At the Third point on circle prompt, snap to a third vertex on the other square.
   A circle is created with a circumference that intersects the three ends you picked.
To draw a diameter circle:
1. From the Curve menu, click Circle.
2. At the Center of circle (Deformable Vertical 2Point 3Point Tangent AroundCurve) prompt, click 2Point.
3. At the First point on circle prompt, pick a point on the screen.
4. At the Second point on circle prompt, type 3 and press Enter, then turn Ortho on and pick to the right.

A circle is created with the two points you picked as the diameter, and the diameter was constrained to a value of 3.

To draw a tangent, tangent, radius circle:
1. From the Curve menu, click Circle.
2. At the Center of circle (Deformable Vertical 2Point 3Point Tangent AroundCurve) prompt, click Tangent.
3. At the First point (Point) prompt, select the circle you just created near the top edge.
4. At the Second point or radius <5> (Point FromFirstPoint) prompt, type 2 and press Enter.
5. At the Second point or radius <2> (Point FromFirstPoint) prompt, pick the other circle.

A circle is created that is tangent to the two circles you selected with a radius of 2.
To draw a tangent, tangent, tangent circle:
1. From the Curve menu, click Circle.
2. At the Center of circle (Deformable Vertical 2Point 3Point Tangent AroundCurve) prompt, click Tangent.
3. At the First point (Point) prompt, select a circle you created.
4. At the Second point or radius <2> (Point FromFirstPoint) prompt, select another circle or line.
5. At the Third point (Point) prompt, pick another piece of geometry.
   A circle is created that is tangent to the three pieces of geometry that you selected.

To draw a circle vertical to the construction plane:
1. From the Curve menu, click Circle.
2. At the Center of circle (Deformable Vertical 2Point 3Point Tangent AroundCurve) prompt, click Vertical.
3. At the Center of circle (2Point) prompt, pick a point.
4. At the Radius <4> (Diameter) prompt, type 3 and press Enter.
   The circle is drawn perpendicular to the construction plane. You will be able to see it in the one of the other viewports.
To draw a circle around a curve:

1. From the Curve menu, click Circle.
2. At the Center of circle (Deformable Vertical 2Point 3Point Tangent AroundCurve) prompt, click AroundCurve.
3. At the Center of circle prompt, pick a point.
4. At the Radius <2> (Radius) prompt, click Radius.
5. At the Radius <2> (Diameter) prompt, type 1 and press Enter.

The circle is drawn perpendicular to the curve at the point you picked. You will be able to see it in the Perspective viewport.
Exercise 21—Practice drawing circles

1. Start a new model. Save as Circles.
2. From the Edit menu, click Layers, and then click Edit.
3. In the Layers window, click the New icon three times.
4. Rename the new layers Box, Line, Circle.
5. Change the color of the Box layer to green, Line to cyan, and Circle to red.
6. Draw the lines and circles on the appropriate layers.

Use Line Segments for the box and Single Line for the centerlines. You will use several of the circle options and object snaps to complete this model.

To make it 3-D:

1. Select the lines that form the rectangle.
2. From the Surface menu, click Extrude.
3. At the Distance (Direction BothSides=No Cap=No Mode=Straight) prompt, click Cap.
4. At the Distance (Direction BothSides=No Cap=Yes Mode=Straight) prompt, type 2 and press Enter.

The rectangle generates a box.
5 Select the circles.
6 From the **Surface** menu, click **Extrude**.
7 At the **Distance** ( **Direction BothSides=No Cap=Yes Mode=Straight** ) prompt, type **-6** and press **Enter**.
8 At the **Distance** ( **Direction BothSides=No Cap=Yes Mode=Straight** ) prompt, drag the mouse in the Front view and click.
The circles generate cylinders.

**Exercise 22—Using circle-related object snaps**
1 Start a new model. Save as **Link**.
2 Complete the model as shown.
3 Draw the three large circles first.
4 Draw the small holes next.
   Use object snaps to snap to the centers of the large circles.
To draw the tangent lines:

1. From the Curve menu, click Lines, and then click Single Line.
2. At the Start of line (Normal Angled Vertical FourPoint Bisector Perpendicular Tangent Extend BothSides) prompt, click Tangent.
3. At the Start of line prompt, pick on the edge of one of the circles near where you want the tangent line to attach.
4. At the End of line prompt, pick on the edge of another circle it will find the tangent points for you.
5. Continue to use this command to complete the model.
6. Save your model.
Drawing Arcs

You can create arcs using various points on the arc and construction geometry.
You can continue an existing curve with an arc to an existing curve to a point or by an angle.

<table>
<thead>
<tr>
<th>Button</th>
<th>Command</th>

</tr>
</thead>
<tbody>
<tr>
<td>Deformable</td>
<td>Creates uniform cubic splines. You can enter the number of control points.</td>
</tr>
<tr>
<td>Extension</td>
<td>Extend a curve with an arc.</td>
</tr>
</tbody>
</table>
Exercise 23—Practice drawing arcs (1)

- Open the model Arc1.3dm.

To draw a center, start, end or angle arc:

1. From the Curve menu, click Arc.
2. At the Center of arc (Deformable StartPoint Tangent Extension) prompt, snap to the center of the circle at the lower left.
3. At the Start or arc prompt, snap to the end of the line.
4. At the End of arc prompt, snap to the end of the other line.

To draw a start, end, direction arc:

1. From the Curve menu, click Arc, and then click Start, End, Direction.
2. At the Start of arc (Deformable) prompt, pick a start point.
3. At the End of arc (Direction ThroughPoint) prompt, pick an end point.
4. At the Direction at start prompt, toggle Ortho on and drag straight up for the tangent at the start point and pick.

5. Make another Direction Arc at the upper right.

To add more arc segments:

1. From the Curve menu, click Arc.
2. At the Center of arc (Deformable StartPoint Tangent Extension) prompt, type E and press Enter.
3. At the Select curve near end prompt, pick near the end of the arc you just made.
4. At the End of arc (Center) prompt, type and press Enter.
5. At the End of arc (Center) prompt, with Ortho on pick a point below the first point. The arc will be tangent to the curve you chose.

6. From the Curve menu, click Arc.
7 At the **Center of arc** (Deformable StartPoint Tangent Extension) prompt, type **E** and press **Enter**.
8 At the **Select curve near end** prompt, pick near the end of the arc you just made.
9 At the **End of arc** (Center) prompt, snap to the end of the line.

**To draw a tangent, tangent, radius arc:**
1 From the **Curve** menu, click **Arc**, and then click **Tangent, Tangent, Radius**.
2 At the **First tangent curve** (Point) prompt, pick the lower right side of the top circle.
3 At the **Second tangent curve or radius <1>** (Point FromFirstPoint) prompt, type **3** and press **Enter**.
4 At the **Second tangent curve or radius <3>** (Point FromFirstPoint) prompt, pick the upper right side of the lower circle.
5 At the **Choose arc** prompt, move your cursor and pick when the correct arc is displayed.

6 From the **Curve** menu, click **Arc**, and then click **Tangent, Tangent, Radius**.
7 At the **First tangent curve** (Point) prompt, pick the upper left side of the top circle.
8 At the **Second tangent curve or radius <1>** (Point FromFirstPoint) prompt, type **6** and press **Enter**.
9 At the **Second tangent curve or radius <6>** (Point FromFirstPoint) prompt, pick the lower left side of the lower circle.
10 At the **Choose arc** prompt, move your cursor and pick when the correct arc is displayed.

11 Save your model.

**Exercise 24—Practice drawing arcs (2)**

Draw construction centerlines first: use their intersection point to draw your arcs and circles.

1 Start a new model. Save as **Arc2**.
2 Create this model using object snaps and the **Line**, **Circle**, and **Arc** commands.
To make it solid:

1. Select the curves.
2. From the **Surface** menu, click **Extrude**.
3. At the **Distance** (Direction BothSides=No Cap=No Mode=Straight) prompt, click **Cap**.
4. At the **Distance** (Direction BothSides=No Cap=Yes Mode=Straight) prompt, type **1** and press Enter.

The curves have been extruded and capped.

### Drawing Ellipses and Polygons

You can draw ellipses from the center or by the ends. You can draw polygons from a center point or an edge. You can draw a rectangle from diagonal corners or by choosing three points.

### Ellipses

<table>
<thead>
<tr>
<th>Button</th>
<th>Command</th>

<tr>
<td></td>
<td>Vertical</td>
<td>Draw a rectangle that is perpendicular to the construction plane.</td>
</tr>
<tr>
<td></td>
<td>Rounded</td>
<td>Create a rectangle with rounded corners (arc or conic).</td>
</tr>
</tbody>
</table>
Exercise 25—Practice drawing ellipses and polygons

Start a new model. Save as Toy.

To draw a rectangle from diagonal corners:
1. From the Curve menu, click Rectangle.
2. At the First corner of rectangle (3Point Vertical Center Rounded) prompt, type -10,-5 and press Enter.
3. At the Other corner or length prompt, type 20 and press Enter.
4. At the Width prompt, type 10 and press Enter.

Draw rectangles from a center point with a length and width, and rounded corners:
1. From the Curve menu, click Rectangle, and then click Center, Corner.
2. At the Center of rectangle (Rounded) prompt, type R, and press Enter to give the rectangle rounded corners.
3. At the Center of rectangle prompt, type 0,0 and press Enter.
4. At the Corner or length prompt, type 19 and press Enter.
5. At the Width prompt, type 9 and press Enter.
6 At the Rho or point for conic corner to pass through <1> (Corner=Arc) prompt type 1, and press Enter.
   If you are creating a rounded rectangle, select a point in the corner to set its curvature.
   Or, type C, and press Enter to toggle from circular rounded corners to conic rounded corners.
7 Repeat these steps for a second rounded rectangle with a length of 18 and a width of 8 with .5 radius corners.

To draw an ellipse from its center and axis ends:
1 From the Curve menu, click Ellipse, and then click From Center.
2 At the Center of ellipse (Corner Diameter FromFoci AroundCurve) prompt, type 0,0 and press Enter.
3 At the End of First axis (Corner) prompt, type 4, and press Enter.
4 At the End of First axis (Corner) prompt, toggle Ortho on and pick to the right.
5 At the End of Second axis prompt, type 3, and press Enter.
6 At the End of second axis prompt, pick a point.

To draw a polygon from its center and radius:
1 From the Curve menu, click Polygon, and then click Center, Radius.
2 At the Center of inscribed polygon (NumSides=4 Circumscribed Edge Star Vertical AroundCurve) prompt, type 3 and press enter to change the number of sides for the polygon.
3 At the Center of inscribed polygon (NumSides=3 Circumscribed Edge Star Vertical AroundCurve) prompt, type -7,-2 and press enter to locate the center point for the polygon.
4 At the Corner of polygon (NumSides=3) prompt, type 1.5, and press Enter.
5 At the Corner of polygon (NumSides=3) prompt, pick a point to orient the polygon.
6 Continue drawing the rest of the polygons. Use the same radius for each one.
To make the rounded rectangles solid:
1. Select the larger rounded rectangle.
2. From the Surface menu, click Extrude.
3. At the Distance (Direction BothSides=No Cap=No Mode=Straight) prompt, click Cap.
4. At the Distance ... prompt, drag it down to set the thickness and click.

To make the rounded rectangle hollow:
1. Select the outer rounded rectangle.
2. From the Solid menu, click Difference.
3 At the **Select second set of surfaces or polysurfaces**. ... prompt, select inner rounded rectangle, and press **Enter**.

**To make the rectangle solid:**

1 Select the rectangle.
2 From the **Surface** menu, click **Extrude**.
3 At the **Distance** (Direction BothSides=No Cap=Yes Mode=Straight) prompt, click **Cap**.
4 At the **Distance** ... prompt, drag it up to set the thickness and click.

**To make the ellipse solid:**

1 Select the ellipse.
2 From the **Surface** menu, click **Extrude**.
3 At the **Distance** (Direction BothSides=No Cap=Yes Mode=Straight) prompt, click **Cap**.
4 At the **Distance** (Direction BothSides=No Cap=Yes Mode=Straight) prompt, click **Bothsides**.
5  At the **Distance** ... prompt, pick to set the thickness.

**To cut the ellipse solid from the rectangle:**
1  Select the solid rectangles.
2  From the **Solid** menu, click **Difference**.
3  At the **Select second set of surfaces or polysurfaces** ... prompt, select the solid ellipse, and press **Enter**.

**To extrude the polygons:**
1  Select the polygons.
2  From the **Surface** menu, click **Extrude**.
3  At the **Distance** ( Direction BothSides=No Cap=No Mode=Straight ) prompt, click **Cap**.
4  At the **Distance** ( Direction BothSides=No Cap=Yes Mode=Straight ) prompt, click **Bothsides**.
5  At the **Distance** ... prompt, pick to set the thickness.

**To cut holes with the solid polygons:**
1  Select the solid rectangles.
2  From the **Solid** menu, click **Difference**.
3  At the **Select second set of surfaces or polysurfaces** ... ( DeleteInput=Yes ) prompt, type **D** and press **Enter**.

---

**Notes:**

Boolean Difference
4 At the **Select second set of surfaces or polysurfaces. ... ( DeleteInput=No )** prompts, select the solid polygons and press **Enter**.

Holes will be cut, but the objects will remain.

---

**Modeling Free-Form Curves**

The use of free-form curves allows more flexibility to create complex shapes.

<table>
<thead>
<tr>
<th>Button</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Curve" /></td>
<td>Curve</td>
<td>Curve by control points draws a curve from specified control points. Control points mostly do not lie on the curve, but they determine its shape.</td>
</tr>
<tr>
<td><img src="image" alt="InterpCrv" /></td>
<td>InterpCrv</td>
<td>Interpolated curve creates a curve going through specified interpolate points. These points lie on the curve and determine its curvature.</td>
</tr>
<tr>
<td><img src="image" alt="Conic" /></td>
<td>Conic</td>
<td>Draw a conic curve, which is part of an ellipse, parabola, or hyperbola.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undo</td>
<td>Allows you to back up one point.</td>
</tr>
<tr>
<td>Close</td>
<td>Makes a closed curve.</td>
</tr>
<tr>
<td>Sharp</td>
<td>If Yes, makes a closed curve with a sharp point.</td>
</tr>
<tr>
<td>Degree</td>
<td>Allows you to set the degree of the curve.</td>
</tr>
</tbody>
</table>

**Exercise 26—Practice drawing curves (1)**

1 **Open** the model **Curve.3dm**.

In this exercise, you will learn how to make a curve by control points, an interpolated curve, and a conic curve to compare the differences between the three methods.

A common method to create with free-form curves is to draw lines that are accurately measured to use as guidelines. In this exercise the guidelines have been created for you.
2 In the Osnap toolbar, check **End** and **Near**, clear all others.  
   If you click **End** with your right mouse, it will clear all the others.  
3 Toggle **Ortho** and **Snap** off.

**To draw a curve by control points:**

1. From the **Curve** menu, click **Free-form**, and then click **Control Points**.
2. At the **Start of curve** (Degree=3) prompt, snap to the end point of the polyline guideline.
3. At the **Next point** (Degree=3 Undo) prompt, snap on the polyline guideline using the **Near** object snap.
4. At the **Next point** (Degree=3 Undo) prompt, snap on the polyline guideline using the **Near** object snap until you get to the end.
5. At the **Next point** (Degree=3 Close Sharp=Yes Undo) prompt, press **Enter**.  
   A free-form curve is drawn. The control points, while on the guideline, were not on the curve itself except at the two ends.
   Control points control the curvature of the curve, but the curve is usually not on them.

![Free-form curve](image)

**To draw a curve interpolate through points:**

1. Change to the **Interpolated Curve** layer.
2. From the **Curve** menu, click **Free-form**, and then click **Interpolate Points**.
3. At the **Start of curve** (Degree=3 Knots=SqrtChord StartTangent) prompt, snap to the end point of the polyline guideline.
4. At the **Next point of curve** (Degree=3 Knots=SqrtChord EndTangent Undo) prompt, snap on the polyline guideline using the **Near** object snap.
5. At the **Next point of curve** (Degree=3 Knots=SqrtChord EndTangent Undo) prompt, continue to snap to the guideline until you get to the end.

![Interpolated curve](image)
6 At the **Next point of curve** ( Degree=3 Knots=SqrtChord EndTangent Close Sharp=Yes Undo ) prompt, press **Enter**.  
A free-form curve is created from specified interpolate points. These points lie on the curve and determine its curvature.  
Note how difficult it is to make the curve follow the guideline exactly.

![Diagram of a curve with points labeled](image)

**To draw a conic curve:**

1 Change to the **Conic** layer.
2 From the **Curve** menu, click **Conic**.
3 At the **Start of conic** ( Tangent Perpendicular ) prompt, snap to the point (1) at the lower left.
4 At the **End of conic** ( Apex Tangent Perpendicular ) prompt, snap to the point (2) above and to the right from the previous point.
5 At the **Apex** prompt, snap to the point (3) in between the previous points.
6 At the **Curvature point or rho** prompt, pick a point for the desired curvature.

![Diagram of a conic curve with points labeled](image)
Modeling Helix and Spiral

The use of free-form curves allows more flexibility to create complex shapes. If you need to control precision, you can make construction lines that define your overall parameters.

<table>
<thead>
<tr>
<th>Button</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Helix</td>
<td>Draw a helix. User can specify a radius, the number of turns, the length and direction of the axis.</td>
</tr>
<tr>
<td></td>
<td>Spiral</td>
<td>Draw a spiral. User can specify two radii, the number of turns, the length and direction of the axis.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical</td>
<td>The helix or spiral axis will be perpendicular to the construction plane in the active viewport.</td>
</tr>
<tr>
<td>AroundCurve</td>
<td>Select a curve for the helix or spiral to wind around to create &quot;phone cord&quot; shapes.</td>
</tr>
<tr>
<td>Flat</td>
<td>Lets you draw a planar spiral.</td>
</tr>
<tr>
<td>Mode</td>
<td>Determines whether the number of turns or the distance between turns is used to create the helix or spiral</td>
</tr>
<tr>
<td>Turns</td>
<td>Allows you to set the number of turns along the axis.</td>
</tr>
<tr>
<td>Pitch</td>
<td>Allows you to set the distance between turns along the axis.</td>
</tr>
<tr>
<td>ReverseTwist</td>
<td>Allows you to reverse the twist direction of the helix or spiral.</td>
</tr>
</tbody>
</table>

To draw a helix

1. Change to the Helix layer.
2. Turn on the End and Point object snap.
3. From the Curve menu, click Helix.
4. At the Start of axis (Vertical AroundCurve) prompt, snap to the end of the vertical line (1) in the Perspective viewport.
5. At the End of axis prompt, snap to the end of the vertical line (2) in the Perspective viewport.
6 At the **Radius and start point <1.000>** (Diameter Mode=Turns Turns=10 Pitch=1 ReverseTwist=No) prompt, pick the point (3) to the right of the axis line.

A helix with 10 turns and a radius of 2.5 is created.

To draw a spiral:

1. Change to the **Spiral** layer.
2. From the **Curve** menu, click **Spiral**.
3. At the **Start of axis** (Flat Vertical AroundCurve) prompt, snap to the end of the other vertical line (1) in the **Perspective** viewport.
4. At the **End of axis** prompt, snap to the other end of the same line (2).
5. At the **First radius and start point <1>** (Diameter Mode=Turns Turns=10 Pitch=1 ReverseTwist=No) prompt, click **Mode**.
6. At the **First radius and start point <0.735>** (Diameter Mode=Pitch Turns=10 Pitch=1 ReverseTwist=No) prompt, click **Pitch**.
7. At the **Pitch <1>** prompt, type 4 and press **Enter**.
8. At the **First radius and start point <1>** (Diameter Mode=Pitch Turns=10 Pitch=4 ReverseTwist=No) prompt, click **ReverseTwist**.
9. At the **First radius and start point <1>** (Diameter Mode=Pitch Turns=10 Pitch=4 ReverseTwist=Yes) prompt, snap the point (3) for the radius of the base of the spiral.
10. At the **Second radius <0>** (Diameter Mode=Pitch Turns=10 Pitch=4 ReverseTwist=Yes) prompt, snap to the other point (4) for the ending radius.

A spiral is created with a reverse twist and a pitch of 4.
Exercise 27—Drawing free-form curves

In the following exercise we will draw the guidelines and free-form curves for a toy screwdriver.

1. Start a new model. Save as Screwdriver.
2. Create Construction and Curve layers.
   Make them different colors.

To create the construction lines:
1. Change to the Construction layer.
2. Draw a polyline using the dimensions above for the guideline.

To create the curve by control points:
1. Change to the Curve layer.
2. Use the Curve command to draw the shape for the toy screwdriver.
   - 2 POINTS IN A ROW (ORTHO) WILL GIVE YOU A TANGENT AT THE ENDPOINT
   - 3 POINTS IN A ROW (ORTHO) WILL ALLOW YOU TO MAKE THE NEXT SEGMENT A STRAIGHT LINE

3. Save your model.
To make it solid:

1. Toggle Snap and Ortho on.
2. From the Surface menu and click Revolve.
3. At the Select curve to revolve prompt, select the curve.

4. At the Start of revolve axis prompt, snap to the end of the curve.
5. At the End of revolve axis prompt, snap to the other end of the curve.
6. In the Revolve Options dialog box, click OK.

Your model is now a three-dimensional surface.
Editing Objects

Once you create objects, you can move and edit them to produce complex and detailed variations.

Fillet

Fillet connects two lines, arcs, circles, or curves extending or trimming them to touch or to join with a circular arc.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Radius</td>
<td>Sets the fillet radius. A radius of 0 extends or trims the curves to a corner, but does not create a fillet.</td>
</tr>
<tr>
<td>Join</td>
<td>Yes joins the fillet to the curves. No does not join the fillet to the curves.</td>
</tr>
<tr>
<td>Trim</td>
<td>Yes trims the curves to the fillet arc. No does not trim the curves.</td>
</tr>
</tbody>
</table>

Exercise 28—Fillet

1. Open the model Fillet.3dm.

To fillet lines at a zero radius:

1. From the Curve menu, click Fillet.
2. At the Select first curve to fillet (Radius=0 Join=No Trim=Yes) prompt, click Radius to change the radius.
3. At the Fillet radius <1> prompt, type 0, and press Enter.
   This Radius option remains the default until you change it.
4. At the Select first curve to fillet (Radius=0 Join=No Trim=Yes) prompt, select an outer vertical line.
5 At the **Select second curve to fillet** ( Radius=0 Join=No Trim=Yes ) prompt, select an adjacent horizontal line.

The ends of the lines are trimmed to a corner.

6 Press *Enter* to repeat the command.

7 **Fillet** the other corners, as shown.

---

**To fillet lines using an arc:**

1 From the **Curve** menu, click **Fillet**.

2 At the **Select first curve to fillet** ( Radius=0 Join=No Trim=Yes ) prompt, type 2 and press *Enter* to change the radius.

   This is another method to change the radius.

3 At the **Select first curve to fillet** ( Radius=2 Join=No Trim=Yes ) prompt, click **Join** to change the Join option to Yes.

   This option joins the curves as they are filleted.

4 At the **Select first curve to fillet** ( Radius=2 Join=Yes Trim=Yes ) prompt, select an outer vertical line.

5 At the **Select second curve to fillet** ( Radius=2 Join=Yes Trim=Yes ) prompt, select an adjacent horizontal line.

   The ends of the lines are trimmed to a radius.

6 Press *Enter* to repeat the command.
7 Fillet the other corners as shown.

8 Press Enter to repeat the command.
9 At the Select first curve to fillet (Radius=2 Join=Yes Trim=Yes) prompt, type 1 and press Enter.
   This radius will be used for the smaller object.
10 At the Select first curve to fillet (Radius=1 Join=Yes Trim=Yes) prompt, select an outer vertical line.
11 At the Select second curve to fillet (Radius=1 Join=Yes Trim=Yes) prompt, select an adjacent horizontal line.
12 Fillet the other corners as shown.

To fillet circles:
1 From the Curve menu, click Fillet.
2 At the Select first curve to fillet (Radius=1 Join=Yes Trim=Yes) prompt, type 3 and press Enter.
3 At the Select first curve to fillet (Radius=3 Join=Yes Trim=Yes) prompt, click Trim.
   This also disables the Join option.
4 At the Select first curve to fillet (Radius=3 Trim=No) prompt, select the right edge of a circle.
5 At the Select second curve to fillet (Radius=3 Trim=No) prompt, select the right edge of the other circle.

Notes:
6 Repeat the command for the left side of the circles.

To fillet and join arcs and lines:
1 From the Curve menu, click Fillet.
2 At the Select first curve to fillet (Radius=3 Trim=No) prompt, click Trim.
3 At the Select first curve to fillet (Radius=3 Join=Yes Trim=Yes) prompt, select one of the arcs in the middle of the viewport.
4 At the Select second curve to fillet (Radius=3 Join=Yes Trim=Yes) prompt, select the other arc in the middle of the viewport.
5 Repeat this procedure for the arc and the line at the bottom left.

To join the filleted objects:
1 Select the objects at the top with a window.
2 From the Edit menu, click Join.
   The objects are joined together. Curves join only if they touch.

**To make a lofted surface:**

1 Change to the Surfaces layer.
2 Select the two squares in the upper left part of the Top viewport.
3 Change to the Perspective viewport.
4 From the Surface menu, click Loft.
   The two squares show a seam direction arrow. They point the same direction.

5 At the Select seam point to adjust, press Enter when done (FlipDirection Automatic Natural) prompt, press Enter.
6 In the Loft Options dialog box, click OK.
   A surface is generated between the two closed polylines.

**Notes:**

The lines in this model are at two different elevations. You are going to connect the lines at different elevations with a surface.
7 Repeat the procedure for the rounded squares.
8 In the **Loft Options** dialog box, click **OK**.

![Perspective](image)

9 Save your model.

**Chamfer**

Chamfer connects two curves by extending or trimming them to intersect or to join with a beveled line. Chamfer works on convergent or intersecting curves.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Distances</td>
<td>The first chamfer distance specifies the distance from the chamfer end on the first curve to the point where the two curves would intersect. The second chamfer distance specifies the distance of the chamfer end on the second curve to the intersection point. A chamfer distance of 0 trims or extends that curve to the intersection point. If the chamfer distance is non-zero, a chamfer line is created that far from the intersection, and the curve is extended to the chamfer line. If you enter 0 for both distances, the curves are trimmed or extended to their intersection, but no chamfer line is created.</td>
</tr>
</tbody>
</table>

**Exercise 29—Chamfer**

- **Open** the model Chamfer.3dm.

**To chamfer lines:**

1 From the **Curve** menu, click **Chamfer**.

2 At the **Select first curve to chamfer** (Distances=1,1 Join=No Trim=Yes) prompt, type **1,1**, and press **Enter**, to set the distances.

3 At the **Select First Curve to chamfer** (Distances=1,1 Join=No Trim=Yes) prompt, select one of the inner vertical lines.
4 At the **Select Second Curve to chamfer** ( Distances=1,1 Join=No Trim=Yes ) prompt, select an adjacent horizontal line.

5 Continue creating chamfers on all of the corners as shown.

6 Press **Enter** to repeat the command.

7 At the **Select First Curve to chamfer** ( Distances=1,1 Join=No Trim=Yes ) prompt, type **3,2** and press **Enter**.

8 At the **Select First Curve to chamfer** ( Distances=3,2 Join=No Trim=Yes ) prompt, select one of the outer horizontal lines.

9 At the **Select Second Curve to chamfer** ( Distances=3,2 Join=No Trim=Yes ) prompt, select an adjacent vertical line.

The first value is the distance along the first curve selected, the second value is the distance along the second line selected.

10 Continue creating chamfers on all of the corners as shown.

**To join the chamfered objects:**

1 From the **Edit** menu, click **Select**, and then click **Curves**.

2 From the **Edit** menu, click **Join**.

   The curves have been joined together into closed polylines.

**To turn the curves into surfaces:**

1 Change to the **Surfaces** layer.
2 From the **Edit** menu, click **Select**, and then click **Curves**.

3 From the **Surface** menu, click **Loft**.

4 At the **Select seam point to adjust, press Enter when done** (FlipDirection Automatic Natural) prompt, press **Enter**.

5 In the **Loft Options** dialog box, click **OK**.

A surface is generated between the two chamfered rectangles.

6 Save your model.

**Exercise 30—Practice with Fillet and Chamfer**
1. Open the model Filletex.3dm.

2. Use Fillet and Chamfer to edit the drawing as shown. All fillets and rounds use a radius of 0.5 units.

To make it solid:
1. From the Edit menu, click Select, and then click Curves.
2. From the Solid menu, click Extrude Planar Curves.
3. At the Extrusion distance (Direction Cap=Yes BothSides Tapered) prompt, type .5 and press Enter.
Move

Use Move to move objects without changing orientation or size.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical</td>
<td>Moves the selected objects vertical to the current construction plane.</td>
</tr>
</tbody>
</table>

**Exercise 31—Move**

1. **Open** the model **Move.3dm**.

2. Turn off both **Ortho** and **Snap** so you can move objects freely.

3. Turn **Cen** object snap on.

**To move using object snaps for placement:**

1. Select the small circle at the bottom left side of the **Top** viewport.
2. From the **Transform** menu, click **Move**.
3. At the **Point to move from** (Vertical) prompt, snap to the center of the small circle.
4. At the **Point to move to** prompt, snap to the center of the arc at the lower left of the object.

**To move using absolute coordinates:**

1. From the **Edit** menu, click **Select**, and then click **Curves**.
2. From the **Transform** menu, click **Move**.
3 At the **Point to move from** (Vertical) prompt, snap to the end of the line at the lower part of the object.

4 At the **Point to move to** prompt, type **0,0** and press **Enter**.
   The end of the line is exactly at point **0,0** in the Top viewport.

![Diagram of point at 0,0](image)

**To move using relative coordinates:**

1 Select the large slotted circle in the middle of the object.
   You will move the slotted circle relative to the part.

2 From the **Transform** menu, click **Move**.

3 At the **Point to move from** (Vertical) prompt, pick any point in the Top viewport.
   It is usually better if you pick near the object you are going to move.

4 At the **Point to move to** prompt, type **r0,.25** and press **Enter**.
   The circle is moved down .25 units.

![Diagram of circle moved down .25 units](image)
Copy

Copy duplicates selected objects and places them in a new location. The command can repeat to create more than one copy in the same command sequence.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical</td>
<td>Copies the selected objects vertical to the current construction plane.</td>
</tr>
<tr>
<td>InPlace</td>
<td>Duplicates the object at the current location.</td>
</tr>
</tbody>
</table>

**Exercise 32—Copy**

**To copy using object snaps for placement:**

1. Select the small circle at the lower left of the object.
2. From the **Transform** menu, click **Copy**.
3. At the **Point to copy from** (Vertical InPlace) prompt, snap to the center of the small circle.
4. At the **Point to copy to** prompt, snap to the center of the arc at the upper left of the object.
5. Pick to place the object, and press **Enter**.

**To make multiple copies:**

1. Select the small circle at the lower left of the object.
2. From the **Transform** menu, click **Copy**.
3. At the **Point to copy from** (Vertical InPlace) prompt, snap to the center of the small circle.
4 At the **Point to copy to** prompt, begin picking points on the screen. Each time you pick, a circle will be copied to that location.

5 Press **Enter** to end the command.

### Undo and Redo

If you make a mistake or do not like the results of a command, use Undo. If you decide you want those undone results back after all, use **Redo** command. Redo restores the last thing undone.

<table>
<thead>
<tr>
<th>Rhino Button</th>
<th>Mouse Button</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Left-click or <strong>Ctrl+Z</strong></td>
<td><strong>Undo</strong></td>
<td>Cancels the effects of the last command.</td>
</tr>
<tr>
<td></td>
<td>Right-click or <strong>Ctrl+Y</strong></td>
<td><strong>Redo</strong></td>
<td>Restores the effects of undo.</td>
</tr>
</tbody>
</table>

The number of undos kept in memory can be set in Rhino **Options** on the **General** page, If a command has an Undo option, type **U** to enter it. At the command prompt, type **Undo**. You cannot use the Undo command after you exit the modeling session or open a different model.
Rotate

Use Rotate to move objects in a circular motion around a base point. For precise rotation, enter a number of degrees to rotate. Positive numbers rotate counterclockwise; negative numbers rotate clockwise.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy</td>
<td>Duplicates the object as it is rotated</td>
</tr>
</tbody>
</table>

**Exercise 33—Rotate**

1. Select the large slotted circle in the middle of the object.
2. From the Transform menu, click Rotate.
3. At the Center of rotation (Copy=No) prompt, snap to the center of the slotted circle.
4. At the Angle or first reference point (Copy=No) prompt, type -28 and press Enter.
Grouping objects allows all members of the group to be selected as one. You can then apply commands to the entire group.

<table>
<thead>
<tr>
<th>Rhino Button</th>
<th>Mouse Button</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Left-click</td>
<td>Group</td>
<td>Makes a group from selected objects.</td>
</tr>
<tr>
<td></td>
<td>or Ctrl+G</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Left-click</td>
<td>Ungroup</td>
<td>Removes grouping.</td>
</tr>
<tr>
<td></td>
<td>or Ctrl+Shift+G</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Left-click</td>
<td>AddToGroup</td>
<td>To add objects to a group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Left-click</td>
<td>RemoveFromGroup</td>
<td>To remove objects from a group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Left-click</td>
<td>SetGroupName</td>
<td>To name groups</td>
</tr>
</tbody>
</table>

**Exercise 34—Grouping**

**To group selected objects:**
1. Select the two circles that you placed.
2. From the **Edit** menu, click **Groups**, then click **Group**.

**To add objects to a group:**
1. At the command prompt type **AddT**.
   When the **AddToGroup** command completes, press **Enter**.
2. At the **Select objects** prompt, select the polyline on the left, the original circle, and the slotted circle in the center.
3. At the **Select objects** prompt, press **Enter**.
4. At the **Select group** prompt, select one of the circles in the group.
   The objects are now part of the group.
To remove an object from a group:
1. At the command prompt, type `RemoveFr` and press the Tab key, then press Enter.
   When the `RemoveFromGroup` command completes, press Enter.
2. At the Select objects to extract from group prompt, select the slotted circle.
3. At the Select objects to extract from group prompt, press Enter.

Mirror
Mirror creates a copy of the objects flipped over a specified axis on the construction plane.

Exercise 35—Mirror
1. Select the group.
2. From the Transform menu, click Mirror.
3. At the Start of mirror plane (Copy=Yes) prompt, type 0.0 or snap to the end of the line at the lower right of the part.
4. At the End of mirror plane (Copy=Yes) prompt, toggle Ortho on and pick directly above the previous point.
5. Select the two groups.
6. From the Edit menu, click Groups, then click Ungroup.
Join

Join unites curves that meet at a common end, making a single curve. Join can unite curves that do not touch, if you select them after the command has started. As you select non-touching curves, a dialog box asks if you want to fill the gap.

Exercise 36—Join

1. Select the two polylines.
2. From the Edit menu, click Join.

Scale

Scale changes the size of existing objects without changing their shape. This command scales three-dimensional objects equally along all three axes. There are also 2-dimensional, one-dimensional, and non-uniform scale commands.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy</td>
<td>Preserves the object as it creates a new scaled one.</td>
</tr>
<tr>
<td>Scale factor</td>
<td>Inputs a value for scale factor. Less than one reduces the size, more than one increases the size.</td>
</tr>
</tbody>
</table>

Exercise 37—Scale

1. From the Edit menu, click Select, and then click Curves.
2. From the Transform menu, click Scale, and then click Scale 2-D.
3. At the Origin point (Copy=No) prompt, type 0,0 and press Enter.
4 At the Scale factor or first reference point <1> (Copy=No) prompt, type .75 and press Enter.

The whole part has been scaled to 75 percent of its original size.

To scale using the reference point option:

1. From the Edit menu, click Select, and then click Curves.
2. From the Transform menu, click Scale, and then click Scale 2-D.
3. At the Origin point (Copy=No) prompt, snap to the center of the slotted circle.
4. At the Scale factor or first reference point <.75> (Copy=No) prompt, snap to the quadrant of the slotted circle.

The radius of the slotted circle is the reference for the scale factor.

5. At the Second reference point (Copy=No) prompt, type 1.375 and press Enter.

The slotted circle now has a larger radius of 1.375. Everything else was scaled proportionally.
To make it solid:
1. From the **Edit** menu, click **Select**, and then click **Curves**.
2. From the **Solid** menu, click **Extrude Planar Curves**.
3. At the **Extrusion distance** (Direction Cap=Yes BothSides Tapered) prompt, type 1 and press **Enter**.

![Extrusion View](image)

To scale in 3-D:
1. From the **Edit** menu, click **Select**, and then click **Polysurfaces**.
2. From the **Transform** menu, click **Scale**, and then click **Scale**.
3. At the **Origin point** (Copy=No) prompt, type 0,0 and press **Enter**.
4. At the **Scale factor or first reference point <1>** (Copy=No) prompt, type 1.5 and press **Enter**.

The solid is larger in every dimension.

![Scale 3D View](image)

To scale in one dimension:
1. From the **Edit** menu, click **Select**, and then click **Polysurfaces**.
2. From the **Transform** menu, click **Scale**, and then click **Scale 1-D**.
3. At the **Origin point** (Copy=No) prompt, type 0,0 and press **Enter**.
4. At the **Scale factor or first reference point <1.500>** (Copy=No) prompt, type .5 and press **Enter**.

![Scale 1D View](image)
5 At the **Scaling direction** ( Copy=No ) prompt, move your cursor into the **Front** viewport, toggle **Ortho** on, and pick a point above the previous point.
The object is half as thick.

**Array**

Use the Array commands to make multiple copies of selected objects. Array Rectangular makes rows and columns of objects. Array Polar copies objects in a circle around a center point.

**Exercise 38—Array**

**To create a rectangular array:**

1. **Open** the model **T-Flange.3dm**.
2. **Select** the small cylinder (1) that is visible in the **Top** viewport.
3. From the **Transform** menu, click **Array**, and then click **Rectangular**.
4. At the **Number in x direction <1>** prompt, type **2** and press **Enter**.
5. At the **Number in y direction <1>** prompt, type **2** and press **Enter**.
6. At the **Number in z direction <1>** prompt, type **1** and press **Enter**.
7. At the **Unit cell or x distance** prompt, type **4** and press **Enter**.
8. At the **Y distance or first reference point** prompt, type **1.5** and press **Enter**.

The cylinders are arrayed on the base of the flange.

---

**To create a 3-D array:**

1. Select the cylinder (1) that is visible in the **Front** viewport.

---

2. From the **Transform** menu, click **Array**, and then click **Rectangular**.
3. At the **Number in x direction <2>** prompt, type **2** and press **Enter**.
4. At the **Number in y direction <2>** prompt, type **2** and press **Enter**.
5. At the **Number in z direction <1>** prompt, type **2** and press **Enter**.
6. At the **Unit cell or x distance** prompt, type **2** and press **Enter**.
7. At the **Y distance or first reference point** prompt, type **-2** and press **Enter**.
8. At the **Z distance or reference first point** prompt, type **-4.5** and press **Enter**.

The cylinders are arrayed on both flanges.

---

**Notes:**

The reason that negative numbers are used for the y and z spacing is because the hole is arrayed in the negative direction on those axes.
To make holes in the flange:
1. Save your model.
2. From the **Solid** menu, click **Difference**.
3. At the **Select first set of surfaces or polysurfaces. ...** prompt, pick the flange (1).
4. At the **Select first set of surfaces or polysurfaces. ...** prompt, press **Enter**.
5. At the **Select second set of surfaces or polysurfaces. Press Enter when done.** (DeleteInput=Yes) prompt, pick all of the cylinders (2) for the holes and press **Enter**.
   
The cylinders are subtracted from the flange.

To create a polar array:
1. **Open** the model **Wheel.3dm**.
2. Select the cylinder and the box in the **Top** viewport.
3. From the **Transform** menu, click **Array**, and then click **Polar**.
4. At the **Center of polar array** prompt, snap to the center of the wheel.
5. At the **Number of items <2>** prompt, type 3 and press **Enter**.

**Notes:**

Boolean Difference

Array Polar

You must include the original and the copies as the number in the array.
6  At the **Angle to fill <360>** prompt, press **Enter**.

   The cylinders and ribs are arrayed in a circular pattern around the center of the wheel.

   ![Wheel with cylinders and ribs](image)

**To remove the holes from the wheel:**

1  Save your model.
2  From the **Solid** menu, click **Difference**.
3  At the **Select first set surfaces or polysurfaces** prompt, pick the wheel.
4  At the **Select first set of surfaces or polysurfaces. Press Enter for second set** prompt, press **Enter**.
5  At the **Select second set of surfaces or polysurfaces. Press Enter when done. (DeleteInput=Yes)** prompt, pick all of the cylinders for the holes and press **Enter**.

   The cylinders are subtracted from the flange.

   ![Wheel with holes removed](image)

**To add the ribs to the wheel:**

1  From the **Solid** menu, click **Union**.
2  At the **Select surfaces or polysurfaces to union** prompt, pick the wheel.

   ![Wheel with ribs added](image)
3  At the Select surfaces or polysurfaces to union. Press Enter when done prompt, pick each of the ribs and press Enter.

Trim
Trim cuts and deletes portions of an object to make it end precisely at its intersection with another object.

Exercise 39—Trim
1  Open the model Trim-Split.3dm.
2  From the View menu, click Zoom, and then click Window.
3  Make a window around the grid in the lower left corner of the Top viewport.
4 From the **Edit** menu, click **Trim**.

5 At the **Select cutting objects** (ExtendLines=Off UseApparentIntersections=Off) prompt, select the two outside vertical lines in the grid.

![Image](image1.png)

6 At the **Select cutting objects** (ExtendLines=Off UseApparentIntersections=Off) prompt, press **Enter** to go to the next stage of the command.

7 At the **Select object to trim. Press Enter to clear selection and start over** (ExtendLines=Off UseApparentIntersections=Off) prompt, select each of the horizontal lines at their left and right ends.

The lines are trimmed to the cutting edges.

![Image](image2.png)

8 At the **Select object to trim. Press Enter to clear selection and start over** (ExtendLines=Off UseApparentIntersections=Off) prompt, press **Enter**.

9 From the **View** menu, click **Zoom**, and then click **Extents All**.

10 From the **Edit** menu, click **Trim**.

11 At the **Select cutting objects** (ExtendLines=Off UseApparentIntersections=Off) prompt, select the surface that intersects the sphere in the **Perspective** viewport.
12 At the **Select cutting objects** (ExtendLines=Off UseApparentIntersections=Off) prompt, press **Enter**.

![Perspective](image)

13 At the **Select object to trim.** (ExtendLines=Off UseApparentIntersections=Off) prompt, select the right side of the sphere.

The sphere is trimmed at the surface.

![Perspective](image)

14 At the **Select object to trim.** (ExtendLines=Off UseApparentIntersections=Off) prompt, press **Enter**.

**Split**

Splits one object with another into two objects splits a curve at a point you specify. The Split command breaks the object where it intersects the cutting object but does not delete anything.

**Exercise 40—Split**

1. From the **View** menu, click **Zoom**, and then click **Window**.
2. Make a window around the closed curve in the lower right corner of the **Top** viewport.
3. From the **Edit** menu, click **Split**.
4. At the **Select objects to split** prompt, select the closed curve.
5. At the **Select objects to split** prompt, press **Enter** to go to the next stage of the command.
6 At the Select cutting objects (Point) prompt, select the lines and press Enter.

7 At the Select cutting objects (Point) prompt, press Enter.
The curve is separated into four curves precisely where the lines intersect it.

8 From the View menu, click Zoom, and then click Extents All.
9 From the Edit menu, click Split.
10 At the Select objects to split prompt, select the sphere.
11 At the Select cutting objects (Isocurve) prompt, select the surface that intersects the sphere and press Enter.
The sphere is separated into two pieces precisely where the surface intersects it.
Extend

Extend lengthens an object to make it end precisely at its intersection with another object or you can lengthen an object when there is no intersection.

Exercise 41—Extend

1. Open the model Extend.
2. From the Curve menu, click Extend, and then click Extend Curve.
3. At the Select boundary objects or enter extension length. Press Enter for dynamic extend prompt, select the line at the left.
4. At the Select boundary objects or enter extension length. Press Enter for dynamic extend prompt, press Enter.
5. At the Select curve to extend (Type=Line) prompt, select the left ends of the three curves.
   The line and curves extend to touch the boundary edge on the left.

6. At the Select curve to extend (Type=Line) prompt, press Enter to end the command.

To extend with some of the other options:

1. From the Curve menu, click Extend, and then click Extend Curve.
2. At the Select boundary objects or enter extension length. Press Enter for dynamic extend prompt, select the curve at the right.
3. At the Select boundary objects or enter extension length. Press Enter for dynamic extend prompt, press Enter.
4. At the Select curve to extend (Type=Line) prompt, select the right end of the line.
   The line is extended straight.
5. At the Select curve to extend (Type=Line) prompt, type T and press Enter.
6. At the Type <Line> (Line Arc Smooth) prompt, type A and press Enter.
7. At the Select curve to extend (Type=Arc) prompt, select the right end of the curve.
   The curve continues with a tangent arc to the boundary edge.
8 At the **Select curve to extend** ( Type=Arc ) prompt, type **S** and press enter.

9 At the **Type <Arc>** ( Line Arc Smooth ) prompt, type **S** and press **Enter**.

10 At the **Select curve to extend** ( Type=Smooth ) prompt, select the right end of the arc.

   The arc continues with a tangent curve.

---

**Notes:**

---

**To extend to a surface:**

1 From the **Curve** menu, click **Extend**, and then click **Extend Curve**.

2 At the **Select boundary objects or enter extension length.** ... prompt, select the cylinder on the left.

3 At the **Select boundary objects or enter extension length.** ... prompt, select the surface on the right.

4 At the **Select boundary objects or enter extension length.** ... prompt, press **Enter**.

5 At the **Select curve to extend** ( Type=Smooth ) prompt, type **T** and press **Enter**.

6 At the **Type <Smooth>** ( Line Arc Smooth ) prompt, type **L** and press **Enter**.

7 At the **Select curve to extend** ( Type=Line ) prompt, select both ends of the line and the curve.

   The curves extend to the surface of the sphere and to the surface.
To extend a curve without boundary edges:

1. From the Curve menu, click Extend, and then click By Line.

2. At the Select curve to extend (Type=Line) prompt, select near the curve in the upper right side.

3. At the End of extension prompt, pick a point.
   The curve is extended as a tangent line to the point you picked.

4. From the Curve menu, click Extend, and then click By Arc.

5. At the Select curve to extend (Type=Arc) prompt, select near the upper end of the line on the left.

6. At the Center of arc extension prompt, type 1 and press Enter to set the radius.

7. At the Center of arc extension prompt, pick a point to the left of the line.

8. At the End of extension prompt, pick an end for the arc.
Offset

Offset creates an object parallel or concentric to another object. Use Offset to create specialized copies, such as parallel lines, concentric circles, and concentric arcs, through specified points or at pre-set distances.

Exercise 42—Offset

1. **Open** the model **Offset.3dm**.
2. Maximize the **Top** viewport.
3. From the **Curve** menu, click **Offset**.
4. At the **Select curve to offset** (Distance=1 Corner=Sharp ThroughPoint Tolerance) prompt, select the line.
5. At the **Through point** (Distance=1 Corner=Sharp ThroughPoint Tolerance) prompt, pick on the upper right side of the line.

A parallel line is created.

To offset with the through point option:

1. From the **Curve** menu, click **Offset**.
2. At the **Select curve to offset** (Distance=1 Corner=Sharp ThroughPoint Tolerance) prompt, select the circle.
3. At the **Through point** (Distance=1 Corner=Sharp ThroughPoint Tolerance) prompt, type **T** and press **Enter**.
4 At the **Side to offset** (Corner=**Sharp** Tolerance) prompt, snap to the end of the line you offset. A concentric circle is created that goes through the end point of the line.

### Offset Using Corner Options

#### Sharp

1. From the **Curve** menu, click **Offset**.
2. At the **Select curve to offset** (Distance=4.82974 Corner=**Sharp** ThroughPoint Tolerance) prompt, select the polyline.
3. At the **Through point** (Distance=4.82974 Corner=**Sharp** ThroughPoint Tolerance) prompt, type 1 and press **Enter**.
4. At the **Through point** (Distance=1 Corner=**Sharp** ThroughPoint Tolerance) prompt, pick inside the polyline.
   The polyline is offset with sharp corners.

#### Round

1. Press **Enter** to repeat the command.
2. At the **Select curve to offset** (Distance=1 Corner=**Sharp** ThroughPoint Tolerance) prompt, select the polyline.
3. At the **Through point** (Distance=1 Corner=**Sharp** ThroughPoint Tolerance) prompt, type C and press **Enter**.
4. At the **Corner <Sharp>** (Sharp Round Smooth Chamfer) prompt, type R and press **Enter**.
5 At the **Side to offset** ( Distance=1 Corner=Round ThroughPoint Tolerance ) prompt, pick outside the polyline.

The polyline is offset, but the corners are rounded with arcs.

Smooth

1 Press **Enter** to repeat the command.

2 At the **Select curve to offset** ( Distance=1 Corner=Round ThroughPoint Tolerance ) prompt, select the polyline.

3 At the **Through point** ( Distance=1 Corner=Round ThroughPoint Tolerance ) prompt, type 2 and press **Enter**.

4 At the **Through point** ( Distance=2 Corner=Round ThroughPoint Tolerance ) prompt, type C and press **Enter**.

5 At the **Corner <Round>** ( Sharp Round Smooth Chamfer ) prompt, choose the **Smooth** option, and press **Enter**.

6 At the **Through point** ( Distance=2 Corner=Smooth ThroughPoint Tolerance ) prompt, pick the outside of the polyline.

The polyline is offset, but the corners are rounded with curvature continuous blend curves.

Distance

1 At the **Select curve to offset** ( Distance=2 Corner=Smooth ThroughPoint Tolerance ) prompt, select the free-form curve.

2 At the **Through point** ( Distance=2 Corner=Smooth ThroughPoint Tolerance ) prompt, type 1 and press **Enter**.
3 At the **Through point** (Distance=1 Corner=Smooth ThroughPoint Tolerance) prompt, pick on the one side of the curve.

4 Press **Enter** to repeat the command.

5 At the **Through point** (Distance=1 Corner=Smooth ThroughPoint Tolerance) prompt, pick on the other side of the curve.

6 Select the arc.

7 Press **Enter** to repeat the offset command.

8 At the **Through point** (Distance=1 Corner=Smooth ThroughPoint Tolerance) prompt, pick on the left side of the arc.

**To offset a surface:**

1 From the **Surface** menu, click **Offset**.

2 At the **Select surface or polysurface to offset** prompt, select one of the purple surfaces, and press **Enter**.

3 At the **Offset distance <1>** (Flip Solid Loose Tolerance) prompt, place your cursor over the surface and click your left mouse button.

Notice that the direction of the arrows changed. The normal direction of the surface was flipped by the mouse click. If you have a positive number for offset distance, the surface will be offset in the direction of the normal. If you have a negative number it will offset the opposite direction.

The normals should be pointed toward the concave side of the surface.
4 At the **Offset distance <1>** (Flip Solid Loose Tolerance) prompt, press **Enter**. The surface is offset in the direction of the normals.

**To offset a surface to a solid:**

1 Select the other purple surface.
2 From the **Surface** menu, click **Offset**.
3 At the **Offset distance <1>** (Flip Solid Loose Tolerance) prompt, click on the surface to change the normal direction if necessary.

4 At the **Offset distance <1>** (Flip Solid Loose Tolerance) prompt, choose the **Solid** option and press **Enter**.

5 At the **Offset distance <1>** (Flip Loose Tolerance) prompt, press **Enter** to create the offset surface and the surfaces needed to make the solid.
To offset a polysurface:

1. Select the cylinder.
2. From the **Surface** menu, click **Offset**.
   The normals on a closed polysurface will always point to the outside.

3. At the **Offset distance <1>** (Flip Solid Loose Tolerance) prompt, press **Enter**.
   Each surface of the polysurface is offset as a separate piece.
Exercise 43—Practice

1  Start a new model. Save as Gasket1

2  Use **Circle**, **Arc**, **Trim**, **Fillet**, and **Join** to create the part shown.

3  Use **Extrude Planar Curve** on the **Solid** menu to create the 3-D part. The extrusion thickness is **.125**.
**Exercise 44—Practice**

1. Start a new model. Save as **Cam**.
2. Use **Circle, Arc, Line, Trim, Join, and Array** to draw the part shown.
3. Use **Extrude Planar Curve** on the **Solid** menu to create the 3-D part. The extrusion thickness is 0.5.

**Exercise 45—Practice**

1. Start a new model. Save as **Link**.
2. Use **Line, Arc, Trim, Offset, Join, Fillet** and **Circle** to draw the part shown.
3. Use **Extrude** to create the 3-D part. The extrusion thickness is .5.
Exercise 46—Practice
1. Start a new model. Save as Building.
2. Use Line, Arc, Trim, Offset, Curve, Fillet and Circle to draw the layout of the building shown.
Point Editing

You can display the control points or the edit points of an object so that you can adjust the shape of an object, rather than manipulating the whole object at once. That is called \textit{control point editing}.

You can use point editing on meshes, curves, and surfaces, but not on polysurfaces or solids.

Rhino's curves are represented internally with non-uniform rational B-splines (NURBS). Three things determine the shape of a NURBS curve:

- A list of points called \textit{control points}
- \textit{Degree}
- A list of numbers called \textit{knots}

If you change any of these things, it changes the shape of the curve.

\textbf{A few facts about control points, edit points, and knots}

- Control points do not have to be on the curve.
- Edit points are always on the curve.
- Rhino lets you edit curves and surfaces by moving control points and edit points.
- Knots are parameters (that is, numbers, not points).
- Adding knots to a curve or surface lets you control the movement of the object during control-point editing.
Exercise 47—Control point editing

In this exercise we are going to experiment with moving control points. Understanding how curves and lines react when control points are moved is very important to understanding NURBS modeling.

To edit control points:

1. **Open** the model **Control Point.3dm**. There are pairs of curves with different degrees in the model.

   ![Diagram of control points]

2. Turn **Ortho** and **Snap** on.
3. From the **Edit** menu, click **Select**, and then click **Curves**.
4. From the **Edit** menu, click **Point Editing**, and then click **Control Points On**. (Press **F10**.)

   ![Diagram showing point editing]

5. In the **Front** viewport, select the middle row of points.
6. Drag the points vertically, 5 units.

   ![Diagram showing vertical movement of points]

7. In the **Front** viewport, select two rows of points on either side of the center.
8 Drag the points vertically, 4 units.

Notice that the degree 1 curves (polylines) come to a point at each control point and the control points are exactly on the curve. When a curve or polyline bends at a point like this it is called a kink. If you create a surface from a curve that has a kink, it will have a seam at the kink.

The degree 3 and 5 curves are smooth. The degree 3 curves have more curvature than the degree 5 curves. Individual points have more influence on a small area of the curve with degree 3 curves, while points have greater influence over a wider span of the curve with degree 5 curves.

9 Press Esc twice to turn off the control points.

10 Select the curves.

11 From the **Surface** menu, click **Loft**.
12 In the **Loft options** dialog box, click **OK**.
Because the degree 1 curves were included in the loft, a polysurface is created with a seam at each kink.

![Perspective](image1)

13 Select the surface.
14 Turn on the control points.
The points do not turn on and the following message is displayed on the command line:

**Cannot turn on points for polysurfaces.**
15 **Undo** the loft.

**To change the polylines into curves without kinks:**
1 From the **Curve** menu, click **Edit Tools**, and then click **Rebuild**.
2 At the **Select curves to rebuild** prompt, select both polylines.
3 At the **Select curves to rebuild** prompt, press **Enter**.
4 In the **Rebuild Curve** dialog box change the point count to **7** and the degree to **3**, and click **OK**.
A degree 3 curve cannot have kinks. The curve smoothes and changes shape.

![Rebuild Curve](image2)

To **loft a surface over the curves**:
1 Select all of the curves.
2 From the **Surface** menu, click **Loft**.

![Perspective](image3)
3 In the **Loft Options** dialog box, click **OK**. A single surface appears over the curves. The surface can be edited with control points.

To rebuild a surface:

1. Select the surface.
2. From the **Surface** menu, click **Edit Tools**, then click **Rebuild**.
3. In the **Rebuild Surface** dialog, change the point count to **8** in both the U and V direction. Change the degree to **3** for both U and V. The surface is smoother with fewer control points.

**Nudge Controls**

Another method to move control points and other geometry in a more subtle way is to use the Nudge keys. The nudge keys are the arrow keys on the keyboard activated with the Alt, Ctrl, and Shift keys.
To change the nudge settings:
1. From the **Tools** menu, click **Options**.
2. In the **Options** dialog box, on the **Modeling Aids** page, note the **Nudge settings**. Any of these values can be changed.

To use Nudge commands to move control points:
1. Select a control point in the **Front** viewport.
2. Hold down the **Alt** key down and press an arrow key. Notice that it moves (nudges) the point a small amount.
3. Hold the **Alt** and the **Ctrl** key down and press another arrow key. The movement is much smaller.
4 Hold the **Alt** and the **Shift** key down and press another arrow key. The movement is magnified.

5 Hold the **Alt** and press the **PageUp** or **PageDown** key to nudge in the **Z** direction.

**To use set points to adjust points:**

1 Select all the points along the left edge of the surface.
2 From the **Transform** menu, click **Set Points**.
3 In the **Set Points** dialog box, check **Set X**, and uncheck **Set Y** and **Set Z**.
4 In the **Front** viewport move the points and click. The control points are aligned.
**Exercise 48—Practice with curves and control point editing**

1. Start a new model. Save as **Glass**.

2. Use the **Curve** command to create the half cross-section of the glass.

**To make it 3-D:**

1. From the **Surface** menu, click **Revolve**.
2. At the **Select curves to revolve** prompt, select the curve you created, and press **Enter**.
3. At the **Start of revolve axis** prompt, pick one end of the curve.
4. At the **End of revolve axis** prompt, pick the other end of the curve.

5. In the **Revolve Options** dialog box, check **Deformable**, then click **OK**.

6. Save your model.
7 Experiment with adjusting the control points to see what happens.

8 Incremental Save your model.
9 Delete the surface.
10 Change the original curve and make another revolved surface.

11 Incremental Save your model.
Part Three:
3-D Modeling and Editing
Creating Deformable Shapes

When building models in Rhino, you should first determine which methods should be used for each part of the project. There are two basic ways to model in Rhino—free-form and accurate. Some models require more attention to exact dimensions because they might have to be manufactured or parts may have to fit together. Sometimes it is the shape of the object, not the accuracy that is important. These techniques can be merged together to create accurate, free-form shapes. This tutorial focuses only on the free-form, squishy aspect. The exact size and placement of the objects is not critical. The overall form is the main objective.

This exercise shows:

- Simple surface creation
- Surface rebuilding
- Control point editing
- Curve creation (drawing, projecting)
- Splitting surfaces with curves and surfaces
- Blending between two surfaces
- Lighting and rendering

When you model the rubber ducky, you will use similar modeling techniques for the head and the body. You will create spheres that will be deformed to make the shapes.

If you need to know more about control points and surfaces, search the Rhino Help index for “control points.”
**Exercise 49—Creating a rubber duck**

1. Start a new model. Save as **Duck**.

2. You can use layers to separate your parts, but for this model, it is not necessary.

For more information about layers, look up “layer” the *Rhino Help* index.

Create the body and head shapes

The body and head of the ducky are created by modifying two spheres. The size and placement of the spheres does not need to be exact.

**To create the basic shapes:**

1. From the **Solid** menu, click **Sphere**, and then click **Center, Radius**.

2. At the **Center of sphere** (Diameter 3Point Tangent AroundCurve) prompt, pick a point in the **Front** viewport.

3. At the **Radius <1>** (Diameter) prompt, pick another point in the same viewport to create a sphere.

4. Repeat this procedure for the second sphere.

**To make the spheres deformable:**

1. Select both spheres.

2. From the **Surface** menu, click **Edit Tools**, then click **Rebuild**.
3 In the **Rebuild Surface** dialog box, change the **Point Count** to 8 for both **U** and **V**.

Change the **Degree** to 3 for both **U** and **V**.

Check **Delete Input**, clear **Current Layer** and **ReTrim**, and click **OK**.

The spheres are now deformable. Having more control points allows more control over smaller parts of the surface. A degree-three surface will have a smoother shape when deformed.

![Rebuild Surface dialog box](image)

**To modify the body shape:**

1. Select the large sphere.
2. From the **Edit** menu, click **Control Points**, and then click **Control Points On**.
3. In the **Front** viewport select the control points near the bottom of the sphere.
   
   To window select, drag a box left to right around the control points.

![Control Points On](image)
4 From the **Transform** menu, click **Set Points**.
5 Make the **Set Points** dialog box look like this, and click **OK**.

![Set Points dialog box](image1)

6 Drag the selected control points up.
This aligns all of the selected control points to the same world z-value (vertical in **Front** viewport),
flattening the surface.

![Control points](image2)

**To scale the sphere shape:**

1 Turn off control points and select the body shape.
2 From the **Transform** menu, click **Scale**, then click **Scale1D**.
3 At the **Origin point** (Copy=No) prompt, type **0** and press **Enter**.
4 At the **Scale factor or first reference point <1>** (Copy=No) prompt, with **Ortho** on, pick a point to the right in the **Front** viewport.
5 At the **Second reference point** (Copy=No) prompt, pick a point further to the right in the **Front** viewport.

The body will be shaped more like an ellipsoid.

![Image](image1.png)

**To reshape the chest and tail**

1. Window select the control points at the top right of the body, and drag them to the right to bulge out the chest.

![Image](image2.png)

2. Window select the control points at the upper left edge of the body, and drag them up to form the tail.

Notice in the **Top** viewport that two control points are selected, though in the **Front** viewport, it looks like only one is selected. This is because the second control point is directly behind the one you can see in the **Front** viewport.
To add control for further shaping the tail:

Before we start to edit the tail further, we will add an additional set of points to the tail portion of the body.

1. From the Edit menu, click Control Points, and then click Insert Knot.
2. At the Select curve or surface for knot insertion prompt, pick the body surface. A surface isocurve will be displayed. It will either be in the U or the V direction.
3. At the Point on surface to add knot (Automatic Symmetrical=No Direction=U) prompt, type V and press Enter to change the direction if necessary.
4. At the Point on surface to add knot (Automatic Symmetrical=No Direction=V) prompt, pick a point midway between the tail and the center of the body.
5. At the Point on surface to add knot (Automatic Symmetrical=No Direction=V) prompt, press Enter.

A new set of points in the V direction have been added to the body.

6. Window select the control points at the upper part of the new isocurve, and drag them down to further form the tail and the body.

7. You can adjust the control points further until you get the shape you want.
8. Save your model.
To create the head:

1. In the **Front** viewport, select the small sphere.
2. From the **Edit** menu, click **Control Points**, and then click **Control Points On**.
3. Select the control points on the right side and drag them to begin forming the bill.

4. Window select the control points further back on the same isocurve and drag them forward to widen the bill.

5. Window select control points at the top of the bill and drag them down as shown below.

6. Press **Esc** to turn control points off.

---

**Notes:**

Remember to use a window to select the control points. There may be multiple control points in the same location in this view.
Separate the bill from the head

For the final rendering, the bill must be a different color from the body. To do this, they must be separate surfaces. You can split a single surface into multiple surfaces many ways. The following technique is just one.

**To split a surface with a curve:**

1. In the **Front** viewport create a curve that looks like the illustration below.

2. Select the head.

3. From the **Edit** menu, click **Split**.

4. At the **Select cutting objects. Press Enter to clear selection and start over (Isocurve)** prompt, select the curve you just created.

5. At the **Select cutting objects. Press Enter when done (Isocurve)** prompt, press **Enter**.

The bill and head are now separate surfaces so they can be rendered with different colors.
Create the duck's neck

The ducky needs a neck. You will first make an edge on the surface of the head and a corresponding edge on the surface of the body so you can create a blended surface between the two edges.

To trim the head:

1. Draw a Line across the bottom of the head.

2. Select the line you just created.
3. From the Edit menu, click Trim.
4. At the Select object to trim. Press Enter to clear selection and start over (ExtendLines=No UseApparentIntersections=No) prompt, select the bottom edge of the head.

The bottom of the head is trimmed.
To cut a hole in the body that matches the opening in the bottom of the head:

1. From the **Surface** menu, click **Extrude**, and then click **Straight**.
2. At the **Select curves or surfaces to extrude** prompt, select the edge curve at the bottom of the head.
3. At the **Select curves or surfaces to extrude** prompt, press **Enter**.
4. At the **Extrusion distance** (Direction BothSides=No Cap=No Mode=Steel) prompt, drag the extruded surface until it intersects the top of the duck body and click.

5. Select the cylindrical surface you extruded.
6. From the **Edit** menu, click **Trim**.
7. At the **Select object to trim.** (ExtendLines=No UseApparentIntersections=No) prompt, select the part of the body on the inside of the extruded surface.
8. At the **Select object to trim.** prompt, press **Enter**.

   A hole will be created in the body.

9. **Delete** the extruded surface.
10. **Save** your model.
To create the blend surface between the head and body:

1. From the **Surface** menu, click **Blend Surface**.

2. At the **Select segment for first edge** (PlanarSections Continuity=Curvature) prompt, select the edge curve at the bottom of the head.

3. At the **Select segment for second edge** ... prompt, press select the edge of the hole in the body.

4. At the **Adjust curve seams** ... prompt, press **Enter**.

5. In the **Blend Bulge** dialog box, click **OK**.

   A surface is blended between the body and the head.

6. **Save** your model.
To join the parts:

1. Select the body the blend surface and the back of the head.
2. From the Edit menu, click **Join**.
   
The three surfaces are joined into one. The bill is left separate for rendering purposes.

![Join](image)

To make an eye:

1. From the Solid menu, click **Ellipsoid**.
2. Toggle **Ortho** and **Snap** on to help.
3. At the **Ellipsoid center** ... prompt, pick a point in the Front viewport.
4. At the **End of first axis** ... prompt, pick a point in the vertical direction.
5. At the **End of second axis** prompt, pick a point that creates an elliptical shape.
   
The order of the first two points is important to correctly orient the isocurves on the surface.

![Ellipsoid](image)
At the **End of third axis** prompt, pick a point in the **Top** viewport that creates a round, flat ellipsoid.

To make the pupil for the eye:

To be able to assign a different color for the pupil of the eye, the ellipsoid surface has to be split into two parts. In this example we will use an isocurve to split the ellipsoid into two parts.

1. Select the ellipsoid.
2. From the **Edit** menu, click **Split**.
3. At the **Select cutting objects. ... ( Isocurve )** prompt, click Isocurve.

4. At the **Split point** (Direction=U) prompt, pick on the top part of the surface to define an isocurve for the split.
5. At the **Split point** (Direction=U) prompt, press **Enter**. The surface is split at the isocurve.

6. Select the surface at the top of the ellipsoid.
7 From the **Edit** menu, click **Object Properties**.

8 In the **Properties** window, on the **Material** page, click **Basic**, click on the **Color** button, and select a color for the pupil of the eye, like black.

![Properties window](image)

9 From the **Render** menu, click **Render Preview**.

**To group the parts of the eye:**

1 Select the both eye surfaces.

2 From the **Edit** menu, click **Groups** and then click **Group**.
   The eye parts are grouped as one object.

**To move the eyes to the surface of the head:**

1 Select the eye group.

2 From the **Transform** menu, click **Orient**, and then click **On Surface**.
3 At the **Point to orient from** (OnSurface) prompt, snap to the center of the eye in the **Top** viewport.

![Top View](image1)

4 At the **Surface to orient on** prompt, click on the head.

5 At the **Point on surface to orient to** (Align=U Copy=Yes FlipNormal=No Mirror=None SwapUV=No) prompt, change the Copy option to **No**.

6 At the **Point on surface to orient to** ... prompt, click the location for the eye.

![Perspective View](image2)

7 **Mirror** the eye to the other side of the head.

![Top View](image3)
Render a picture of the ducky

Rendering creates a “realistic” picture of your model with colors you assign. These render colors are different from the layer colors you might be using, which control the display in wireframe and shaded mode.

To render the ducky:
1. Select the beak.
2. From the Edit menu, click **Object Properties**.
3. In the Properties window, on the Material page, click **Basic** and click the color swatch.
4. In the Select Color dialog box, select a color for the beak, like orange.
5. Select the body.
6. From the Edit menu, click **Object Properties**.
7. In the Properties window, on the Material page, check **Basic** and select a color for the body, like yellow.
8. From the Render menu, click **Render**.

![Rendered Ducky Image]
To place lights:

1. From the **Render** menu, click **Create Spotlight**.
2. At the **Base of cone** (Vertical Diameter 3Point Tangent AroundCurve) prompt, select a point in the middle of the model.
3. At the **Radius <1.000> (Diameter)** prompt, drag the radius until it is approximately three times as large as the model.
4. At the **End of cone** prompt, pick a point in the **Top** viewport while holding the **Ctrl** key down to activate elevator mode.
   In the **Front** viewport pick a point slightly above the object.
5. From the **Render** menu, click **Render**.
Modeling with Solids

Modeling solids in Rhino is easy. There are several commands that enable you create and edit solid objects.

Solids in Rhino are closed surfaces or polysurfaces that enclose a volume. Some of the solid primitives are closed single-surfaces carefully edge-matched, others are polysurfaces.

Rhino’s polysurface objects are not deformable. You cannot turn control points on and use them to deform the polysurface.

Exercise 50—Model a bar with text

In the following exercise we will make a solid primitive, extract some surfaces, rebuild a surface and deform it, join the new surfaces into a solid, fillet the edges, add text to a surface, and do a Boolean operation on the solid.

1. Start a new model using the **Millimeters** template. **Save** as **Bar**.
2. From the **Solid** menu, click **Box**.
3. At the **First corner of base** (3Point Vertical Center) prompt, type **0,0** and press **Enter**.
4. At the **Other corner of base or length** prompt, type **15** and press **Enter**.
5. At the **Width. Press Enter to use length** prompt, type **6** and press **Enter**.
6. At the **Height. Press Enter to use length** prompt, type **1** and press **Enter**.

![Perspective view of a bar](image)

**To edit the box:**

1. From the **Solid** menu, click **Extract Surface**.
2. At the **Select surfaces to extract** (Copy) prompt, select the top and both ends.
3. At the **Select surfaces to extract. Press Enter when done** (Copy) prompt, press **Enter**.
4 Select the two ends and delete them.

5 Select the top extracted surface.

6 From the Surface menu, click Edit Tools, then click Rebuild.

7 In the Rebuild Surface dialog box, set the Point count to 4 and the Degree to 3 for both U and V.

8 From the Edit menu, click Point Editing, then click Control Points On.

9 In the Right viewport, window select the middle points and drag them up approximately one unit.

10 Turn off control points.

11 Select all of the surfaces.
12 From the **Edit** menu, click **Join**.

The surfaces are joined making an open polysurface.

13 Select the polysurface.

14 From the **Solid** menu, click **Cap Planar Holes**.

Two end caps are created.

---

**To fillet the edges:**

1 From the **Solid** menu, click **Fillet Edge**.

2 At the **Select edges to fillet** (Radius=1) prompt, select the vertical edges.

3 At the **Select edges to fillet. Press Enter when done** (Radius=1) prompt, press **Enter**.

4 From the **Solid** menu, click **Fillet Edge**.

5 At the **Select edges to fillet** (Radius=1) prompt, type .2 and press **Enter**.

6 At the **Select edges to fillet** (Radius=0.2) prompt, window select the entire bar to get the horizontal edges.
7 At the **Select edges to fillet**. ... (Radius=0.2) prompt, press **Enter**.

8 Make a copy of the bar and lock it.
We will use the second bar for another technique later in the exercise.

**To make solid text:**

1 From the **Solid** menu, click **Text**.
2 In the **Text Object** dialog box, select a **Font**.
   Under **Create** click **Solids**.
   Under **Text size**, set the **Height** to **3.00** and the **Solid thickness** to **1.00**.
   Place the text in the **Top** viewport.

3 Drag the text to the middle of the bar and click.
4 In the **Front** or **Right** viewport, drag the text until it protrudes through the top surface.
To engrave the text in the bar:

1. Select the bar.
2. From the Solid menu, click Difference.
3. At the Select second set of surfaces or polysurfaces (DeleteInput=Yes) prompt, window select all of the text.
4. At the Select second set of surfaces or polysurfaces. Press Enter when done (DeleteInput=Yes) prompt, press Enter.

The text is embossed into the bar.
To make a label:

1. Hide the finished bar and Unlock the copy of the bar.
2. From the Solid menu, click Extract Surface.
3. At the Select surfaces to extract (Copy) prompt, select the top surface.
4. At the Select surfaces to extract (Copy) prompt, press Enter.

5. Select the lower part of the bar and lock it.
6. Make the Top viewport active.
7. From the Solid menu, click Text.
8. In the Text Object dialog box, under Create, click Curves, and click OK.
9. Place the text in the Top viewport.
10. Drag the text to the middle of the bar and click.
To project the text curves through the bar:

1. Select the text (curves).
2. From the Curve menu, click Curve From Objects, and then click Project.
3. At the Select surfaces or polysurfaces to project onto prompt, select the top surface in the Top viewport.
   The Project command projects objects perpendicular to the construction plane.

4. Delete the original text curves.
5. Select the top surface.
6. From the Edit menu, click Split.
7. At the Select cutting objects... prompt, window select the text curves, and press Enter.
   The curves have split the surface. Each part of the text is a separate surface.

8. From the Edit menu, click Select, then click Curves.
   This will select the curves you used to split the surface.
9. From the Edit menu, click Visibility, then click Hide to hide the curves.

To change the render color of the text:

1. Select the text surfaces.
2. From the Edit menu, click Object Properties.
3. In the **Properties** window, on the **Material** page, click **Basic** and select a color for the text, like red.

4. Right click on the **Perspective** viewport title.

5. From the menu, click **Rendered Display**.

The letters render in a different color.
To emboss the text in the bar:

1. Click in the Top viewport.
2. From the Edit menu, click Select, then click Previous Selection.
   This selects the text surfaces again.
3. From the Solid menu, click Extrude Solid, then click Straight.
4. At the Extrusion distance (Direction BothSides=No Cap=Yes Mode=Straight) prompt, type .2
   and press Enter.
   The surfaces are extruded perpendicular to the active construction plane.

Notice that the top of the text follows the curvature of the original surface.
Creating Surfaces

A Rhino surface is similar to a piece of stretchy fabric. It can take on many different shapes.

Surfaces are bounded by curves called edges. To visualize the surface shape Rhino displays a grid of isoparametric curves (isocurves) on the surface.

Surfaces have an area, their shape can be changed by moving control points, and they can be meshed.

</tbody>
</table>
Exercise 51—Basic techniques for making surfaces

1. Start a new model. Save as **Surfaces**.
   In this exercise, you will model some simple surfaces.
2. Turn on **Snap** and **Planar**.
3. From the **Surface** menu, click **Plane**, then click **Corner to Corner**.
4. In the **Top** viewport, at the **First corner of plane** (3Point Vertical Center Deformable) prompt, pick a point.
5. At the **Other corner or length** prompt, pick another point to make a rectangular plane.

To create a vertical plane:

1. From the **Surface** menu, click **Plane**, and then click **Vertical**.
2. At the **Start of edge** prompt, snap to the **End** point at the right side of the surface.
3. At the **End of edge** prompt, snap to the other **End** point at the right side of the surface.
4. At the **Height. Press Enter to use width** prompt, drag your cursor up and pick.
To create a plane from 3 points:
1. From the Surface menu, click Plane, and then click 3 Points.
2. At the Start of edge ... prompt, snap to the endpoint at the left of the first surface.
3. At the End of edge prompt, snap to the other endpoint at the left side of the first surface.
4. At the Width. Press Enter to use length prompt, pick a point in the Front viewport that is angled to the left and the same height as the vertical surface.

To create a plane from corner points:
1. From the Surface menu, click Corner Points.
2. At the First corner of surface prompt, snap to an endpoint at the edge of the first surface (1).
3. At the Second corner of surface prompt, snap to the endpoint at the edge of the first surface (2).
4. At the Third corner of surface prompt, snap to an endpoint at the edge of the third surface (3).
5. At the Fourth corner of surface prompt, snap to the other endpoint at the edge of the third surface (4).

A surface will be created with corners at the points you selected.
To create a plane from edge curves:

1. Draw a curve in the Top viewport that starts and ends at the top of the two vertical surfaces as shown below. Planar mode keeps this curve on the same plane as the surface corners.

2. From the Surface menu, click Edge Curves.

3. At the Select 2, 3, or 4 curves prompt, select the three surface edges and the curve you created. A surface is created.
To create a surface from planar curves:

1. From the Surface menu, click Planar Curves.
2. At the **Select planar curves to build surface** prompt, select the top edge of a surface you just created.
3. At the **Select planar curves to build surface. ...** prompt, select the other three edges and press Enter.

A surface is created.
Exercise 52—Extruding surfaces

In this exercise, you will be creating a cordless phone using extrusions. To aid in organizing the model, surface and curve layers have been created. Make sure you change layers as you are making the extrusions.

1. **Open** the model `Extrude.3dm`.
2. Select the curve (1) as shown below. From the Surface menu, click Extrude, and then click Straight.
3. At the Extrusion distance (Direction BothSides=No Cap=No Mode=Straight) prompt, type -3.5 and press Enter.

If the object being extruded is a planar curve, the curve is extruded perpendicular to the plane of the curve.

4. Press Esc to unselect the curve.
5. Change to the Bottom Surface layer.
6. Repeat this process for the other curve (2).

If you do not get the answer you expected, undo and try picking near the other end of the path curve.
To extrude a curve along another curve:
1. Change to the Top Surface layer.
2. Select the curve on the left (3).
3. From the Surface menu, click Extrude, and then click Along Curve.
4. At the Select path curve (Cap=No Mode=AlongCurve) prompt, select the path curve (4) near its right end.

The curve is extruded along the path of the secondary curve.

5. Change to the Bottom Surface layer.
6. Repeat this process for the other curve (5).

To extrude a curve with a taper (draft angle):
1. Change to the Top Surface layer.
2. Select the curve on the right (1).
3. From the Surface menu, click Extrude, and then click Tapered.
4. At the Extrusion distance (Direction DraftAngle=0 Cap=No Corners=Sharp Mode=Tapered) prompt, click DraftAngle.
5. At the Draft angle <0> prompt, type 3 and press Enter.
6 At the **Extrusion distance** (Direction DraftAngle=3 Cap=No Corners=Sharp Mode=Tapered) prompt, type **.375** and press **Enter**.

The curve is extruded with a three-degree draft angle in the positive direction on the y-axis.

7 Change to the **Bottom Surface** layer.

8 Select the same curve.

9 From the **Surface** menu, click **Extrude**, and then click **Tapered**.

10 At the **Extrusion distance** (Direction DraftAngle=3 Cap=No Corners=Sharp Mode=Tapered) prompt, type **-1.375** and press **Enter**.

The curve is extruded with a three-degree draft angle in the negative direction from the previous extrusion.
To create a surface from a planar curves:

1. Change to the **Top Surface** layer.
2. From the **Surface** menu, click **Planar Curves**.
3. At the **Select planar curves to build surface** prompt, select the edge curves that bound the openings of the tapered extrusion at the top.
4. At the **Select planar curves to build surface. ...** prompt, press **Enter**.
   A surface is created at the end.

5. Change to the **Bottom Surface** layer.
6. Repeat this process for the other end.

7. Select all of the top surfaces.
8. From the **Edit** menu, click **Join**.
   4 surfaces or polysurfaces joined into 1.
9. Repeat this for the bottom surfaces.
To create an extruded surface on both sides of a curve:

1. Turn on the **Extrude Straight-both sides** layer.
2. Select the freeform curve as shown.
3. From the **Surface** menu, click **Extrude**, and then click **Straight**.
4. At the **Extrusion distance** (Direction BothSides=No Cap=No Mode=Straight) prompt, click **Both sides**.
5. At the **Extrusion distance** (Direction BothSides=Yes Cap=No Mode=Straight) prompt, in the **Front** view drag so that it extends past the object and pick.

The curve is extruded symmetrically from the curve.

To split the surface:

1. Select the extruded surface.
2. From the **Edit** menu, click **Split**.
3. At the **Select cutting objects. Press Enter to clear selection and start over** (Isocurve) prompt, click Isocurve.
4. At the **Split point** (Direction=U) prompt, click **Direction** to change the direction of the isocurve if necessary.
5. At the **Split point** (Direction=V) prompt, snap to the intersection where all three surfaces touch in the **Top** viewport.
6  At the **Split point** ( Direction=V ) prompt, press **Enter**.

![Perspective](image)

7  Select the left part of the split surface.

8  From the **Edit** menu, click **Layers**, then click **Change Object Layer**.

9  Make the **Top Surface** layer current and turn off the **Bottom Surface** layer.

![Perspective](image)

**To join the surfaces using Boolean difference:**

Next you will use a Boolean operation to join and trim the surface and the polysurface. Before you start, you should analyze the surface to see which direction the surface normals are pointing and adjust them if necessary. As a general rule, if the normals are pointing toward each other the Boolean operations will work as expected.

1  Select the surface.

2  From the **Analyze** menu, click **Direction**.

3  At the **Press Enter when done** ( UReverse VReverse SwapUV Flip ) prompt, click to change the direction or press **Enter** when it is pointing the direction as illustrated below.

![Perspective](image)

4  Repeat this process for the polysurface.
5 Select the polysurface.
6 From the **Solid** menu, click **Difference**.
7 At the **Select second set of surfaces or polysurfaces** (DeleteInput=No) prompt, click **DeleteInput**.
8 At the **Select second set of surfaces or polysurfaces. Press Enter when done** (DeleteInput=Yes) prompt, pick the surface and then press **Enter**.

The surfaces are trimmed and joined.

9 Repeat this process for the bottom surfaces.

10 Use the **FilletEdge** command (Solid > Fillet Edge) with a radius of .2 to round the edges.
To create an extruded surface from a curve to a point:

1. Turn on the **Extrude to a point** layer.
2. Select the U-shaped curve.
3. From the **Surface** menu, click **Extrude**, and then click **To Point**.
4. At the **Point to extrude to** (Mode=ToPoint) prompt, select the point object near the top surface.
   
   The curve is extruded to the point.

5. Use the **BooleanDifference** command (**Solid** menu: **Difference**) to remove the surface from the top of the phone.

6. Repeat these steps for the bottom part of the phone.

7. **Save** your model as **Phone**.
To create the buttons:

1. Turn on the **Curves for Buttons** layer.
2. In the **Front** view, window select the first column of buttons.
   
   Three curves are selected.

3. From the **Solid** menu, click **Extrude Solid**, then click **Straight**.
4. At **Extrusion distance** (Direction BothSides=No Cap=Yes Mode=Straight) prompt, type **-0.2** and press **Enter**.
5. Repeat these steps for the other columns of buttons.

6. Use the **FilletEdge** command (Solid > Fillet Edge) with a radius of **0.05** to round the edges.
   
   The button edges are rounded.

7. Save your model.
Exercise 53—Lofted surfaces

1. Open the model Loft.3dm.
2. Window select all of the curves.
3. From the Surface menu, click Loft.
   A surface is fitted over the curves.

4. In the Loft Options dialog box, switch Style to Straight sections, then click Preview.
   A surface is fitted through the curves, but the sections are straight between the curves.
5 In the **Loft Options** dialog box, switch **Style** to **Loose**, then click **Preview**.

A surface is created that uses the same control points as the curves. The surface follows the curves more loosely.

Use this option when you want the surface to conform to the control points of the input curve.

![Loft Options dialog box](image)

6 In the **Loft Options** dialog box, switch **Style** to **Normal**, then click **OK**.

7 **Mirror** the surface to create the other half and **Join** the two halves.

![Perspective view](image)

To make a seat:

1 Turn the **Hull Curves** layer off and turn the **Seat Curves**, and **Seat** layers on.
2 Make the **Seat Curves** layer current.
3 In the **Front** view, select the rounded rectangles.
4 From the Curve menu, click Curve From Objects, and then click Project.
5 At the Select surfaces or polysurfaces to project onto prompt, select the hull. The curves will be projected to both sides of the hull surface.

6 Select the curves on the surface.
7 From the Surface menu, click Loft.
8 At the Adjust curve seams (Flip Automatic Natural) prompt, press Enter. A surface is fitted over the curves that fits exactly with the shape of the hull.

To create section curves from the surfaces:
1 Select the hull.
2 Change to the Section layer.
3 From the Curve menu, click Curve From Objects, and then click Section.
4 At the Start of section prompt, in the Top viewport, pick a point to the left at the center of the hull.
5 At the End of section prompt, with Ortho on, drag a line to the right and pick. A curve is generated on the surface. Repeat this at various locations.

To create contour curves across the hull surfaces:

1 Select the hull.
2 Change to the Contour layer.
3 From the Curve menu, click Curve From Objects, and then click Contour.
4 At the Contour plane base point (Range) prompt, snap to the left end of the canoe.
5 At the Direction perpendicular to contour planes prompt, snap to the right end of the canoe.
6 At the Distance between contours <1> prompt, press Enter. A curve is generated every foot along the hull.
To create an edge curve from the surfaces:

1. Change to the **Top Rail** layer.
2. From the Curve menu, click **From Objects**, and then click **Duplicate Edge**.
3. At the **Select edges to duplicate** prompt, pick the top edge of the hull.
4. At the **Select edges to duplicate. Press Enter when done** prompt, pick the other top edge and press **Enter**.

A curve is generated at the edge of the surface.

5. Turn off the **Hull** layer.

You have a wireframe of curves that duplicate the hull surface.
Exercise 54—Revolved surfaces

1 Open the model Revolve.3dm.

2 Select the free-form curve

3 From the Surface menu, click Revolve.

4 At the Start of revolve axis prompt, select one end of the curve.

5 At the End of revolve axis prompt, select the other end of the curve.

6 In the Revolve Options dialog box, click OK.

A surface is revolved around the axis line.

Notes:

Revolve
Look for this button
Exercise 55—Using a rail revolve

Rail Revolve lets you revolve around an axis and along a path curve.

To create a rail revolve:

1. Open the model Rail Revolve.3dm.
2. Select the conic shaped curve.
3. From the Surface menu, click Rail Revolve.
4. At the Select rail curve (ScaleHeight=No) prompt, select the path curve.
5. At the Start of RailRevolve axis prompt, select one end of the axis line.
6. At the End of RailRevolve axis prompt, select the other end of the axis line.
   A surface is revolved around the axis that follows along the curve at the end of the object.
7. Turn the Bowl layer on and other layers off.
8. Use Rail Revolve to make a bowl.
Exercise 56—Using 1-rail sweeps to create surfaces

1. **Open** the model 1 Rail Sweep.3dm.
2. **Select** the three curves on the left.
3. From the **Surface** menu, click **Sweep 1 Rail**.
4. At the **Adjust curve seams** (Flip Automatic Natural) prompt, press **Enter**.
5. In the **Sweep 1 Rail Options** dialog box, click **OK**.
   The two cross section shapes are blended along the rail curve to form the surface.

**To create a 1-rail sweep to a point:**
1. From the **Surface** menu, click **Sweep 1 Rail**.
2. At the **Select rail curve** prompt, select the free-form curve on the right.
3. At the **Select cross section curves** (Point) prompt, select the circle.
4 At the **Select cross section curves** (Point) prompt, click **Point**.

5 At the **Pick end point** prompt, select the other end of the free-form curve.

6 In the **Sweep 1 Rail Options** dialog box, then click **OK**.

   The cross-section will sweep to a point to form the surface.
Exercise 57—Using 2-rail sweeps to create surfaces

- Open the model 2 Rail Sweep.3dm.

To create the base part:

1. Change to the Base Surface layer.
2. From the Surface menu, click Sweep 2 Rails.
3. At the Select rail curves prompt, select the two profile curves.
4. At the Select cross section curves (Point) prompt, select the cross-section curves.
5. At the Select cross section curves (Point) prompt, press Enter.
6. At the Adjust curve seams (Flip Automatic Natural) prompt, press Enter.
7 In the **Sweep 2 Rails Options** dialog box, click **OK**.
A surface is created whose edges match the rail curves.

![Sweep 2 Rails Options dialog box](image)

**To create the housing:**

1 Turn the **Housing Surface**, **Housing Curves**, and **Mirror** layers on.
2 Make the **Housing Surface** layer current.
3 From the **Surface** menu, click **Sweep 2 Rails**.
4 At the **Select rail curves** prompt, select the two rail curves.
5. At the **Select cross section curves** (Point) prompt, select the outer edge of the cylinder, and then press **Enter**.

6. At the **Adjust curve seams** (Flip Automatic Natural) prompt, press **Enter**.

7. In the **Sweep 2 Rails Options** dialog box, click **OK**.

A surface is created.
To join the two parts:

1. Select the base and the housing surfaces.
2. From the Solid menu, click Union.
   The two parts are joined and trimmed.

3. Use the FilletEdge command (Solid menu: Fillet Edge) with a radius of .25 to round the intersecting edge.
Exercise 58—Using a network of curves to create surfaces

1. Open the model **Networksurf.3dm**.

2. From the **Surface** menu, click **Curve Network**.

3. At the **Select curves in network** (NoAutoSort) prompt, select the two edge curves and the cross-section curves, and press **Enter**.

4. In the **Surface From Curve Network** dialog box, change the edge matching to **Curvature**, click **OK**.

A surface is created that has curvature continuity with the other two surfaces.
**Exercise 59—Practice using one-rail sweeps:**

In this exercise you use one rail sweeps to make an end table with free-form tapered legs.

**To create the legs:**

1. **Open** the model Table.3dm.
2. From the **Surface** menu, click **Sweep 1 Rail**.
3. At the **Select rail curve** prompt, select the path curve for the leg.
4. At the **Select cross section curves** (Point) prompt, select the shape curve for both ends of the leg.
5. At the **Select cross section curves. Press Enter when done** (Point) prompt, press **Enter**.
6. At the **Adjust curve seams** (Flip Automatic Natural) prompt, press **Enter**.
7. In the **Sweep 1 Rail Options** dialog box, click **OK**.

The table leg is created. Note the nice transition from one cross-section curve to the other.
To create the brace:
1. Change to the Braces layer.
2. Repeat the previous process to create the brace.

To create the top:
1. Change to the Top layer.
2. From the Surface menu, click Sweep 1 Rail.
3. At the Select rail curve prompt, select the ellipse.
4. At the Select cross section curves (Point) prompt, select the shape curve.
5. At the Select cross section curves. Press Enter when done (Point) prompt, press Enter.
6. In the Sweep 1 Rail Options dialog box, click OK.
   The surface for the rim of top is created.
To finish the table:

1. Select all of the surfaces you created.
2. From the Solid menu, click Cap Planar Holes.
   Six caps were created.

   ![Perspective view of a table with caps]

3. Use Mirror to copy the brace and the leg to finish the model.
   Mirror them around 0,0 in the Top viewport.
Exercise 60—Creating a toy hammer:

In this exercise you will use most of the techniques that you’ve learned in the previous sessions. Some models require more attention to detail. This is an example of a model that requires precise modeling techniques. This exercise also requires a number of different surface creation techniques. The technical drawing is included to help you create a very precise model.

1. Open the model **Hammer**.
2. The following layers have been created: **Construction, Curve, Handle, Tang, Head, Hole, and Claw**.

![Technical drawing of a hammer with dimensions and notes for precise modeling.](image-url)
3 Draw outlines for the hammer in the **Top** viewport.

Drawing outlines helps while drawing the curves. You can either draw lines, polylines, or rectangles to create the outlines. Use the dimensions on the technical drawing to get accurate outlines.

**To create the claw:**

When modeling the shape of the claw, you will use circles, arcs, and curves. You can trim the circles and arcs and then join them together to create a closed curve. You can rebuild the curve and adjust the control points to get a more sculptural shape.

1 Change to the **Curve** layer

2 Draw a curve defining the shape of the claw in the **Top** viewport.

You can use a free-form curve or use a combination of arcs and circles that are trimmed and joined to create the curve. Following is a step-by-step approach to creating the curve for the claw part of the hammer using arcs and circles.

Start by drawing two circles.

3 Use the **Circle** command (Curve menu: Circle > Tangent to 3 curves) to create a circle at the lower end of the claw.

Draw the circles tangent to the construction geometry.

4 Use the **Circle** command (Curve menu: Circle > Tangent, Tangent, Radius) to create a circle at the upper end of the claw that is tangent to the upper right corner with a 4 mm radius.

Draw the circles tangent to the construction geometry.
5 Use the **Arc** command (Curve menu: Arc > Tangent, Tangent, Radius) to create arcs that are tangent to the two circles.

6 Use the **Trim** command (Edit menu: Trim) to trim the inside part of the circles.

7 Use the **Join** command (Edit menu: Join) to join the arc segments.

8 Change to the **Claw** layer.

9 Select the joined segments.

10 Use the **Extrude** command (Solid menu: Extrude > Straight) to extrude the curve on both sides of the construction plane.
To create the head:

1 Change to the **Curve** layer.

2 Use the **Curve** command (Curve menu: Free-form > Control Points) to create the curve for the cross-section of the head.
   Make sure the curve intersects the claw part. This makes joining the two pieces easier.

3 Change to the **Head** layer.

4 Use the **Revolve** command (Surface menu: Revolve) to revolve the curve.
   Use the midpoint of the construction line for the revolve axis.

5 Save your model.

To create slot for the claw part of the hammer:

1 Use the **Curve** command (Curve menu: Free-form > Control Points) to draw a curve for the slotted part of the claw.
   Make sure the curve is symmetrical.
2 Use the **Line** command (Curve menu: Line > Single Line) to draw a line between the endpoints.

3 Use the **Join** command (Edit menu: Join) to join the curve and the line.

4 Drag the closed curve closer to the claw.

5 Use the **Rotate** command (Transform menu: Rotate) to rotate the curve to align more closely with the curve of the claw.

6 Change to the **Claw** layer.

7 Use the **Extrude** command (Solid menu: Extrude > Straight) to extrude the curve through the claw.

8 Save your model.

9 Use the **BooleanDifference** command (Solid menu: Difference) to subtract the slot from the claw.
To finish the claw:

1. Use the **BooleanUnion** command (Solid menu: Difference) to join the head with the claw.

2. Use the **FilletEdge** command (Solid menu: Fillet Edge) to make the fillets around the top and bottom of the claw, the slot, and the intersection between the head and the claw.

3. Save your model.

To create the shape curve for the tang and the handle:

Create the shape curve for the tang in the **Right** viewport. This curve will also be used for the handle.

1. Change to the **Curve** layer and turn on **Ortho**.

2. Use the **Curve** command (Curve menu: Free-form > Control Points) to draw a curve for the upper cross-section of the tang.

   Make sure the curve is symmetrical.

3. Save your model.
To create the tang:

1. Use the Curve command (Curve menu: Free-form > Control Points) to draw one of the curves for the tang of the hammer.
   Make sure that it intersects the claw.

2. Use the Mirror command (Transform menu: Mirror) to create the other curve.
3. Change to the Tang layer.
4. Use the Sweep2 command (Surface menu: Sweep 2 Rails) to make the surface.

To finish the tang:

1. Use the Mirror command (Transform menu: Mirror) to make the other half of the tang.

2. Select both halves.
3. Use the Join command (Edit menu: Join) to join the two surfaces.
4. Select the joined surfaces.
5 Use the **Cap** command (Solid menu: Cap Planar Holes) to make the tang a closed polysurface.

6 Save your model.

**To finish the hammer head:**

1 Select the tang and the claw.
2 Use the **BooleanUnion** command (Solid menu: Difference) to join the tang with the claw and the head.
3 Use the **FilletEdge** command (Solid menu: Fillet Edge) to make the fillets at the intersection between the tang and the claw.
   The edge has a round on it.
4 Save your model.
To create the handle:

1. Change to the **Curve** layer.
2. Use the **Curve** command (Curve menu: Free-form > Control Points) to draw a curve for the top edge of the handle.
   Make it start at the endpoint of the tang profile curve and end on the centerline.

3. Use the **Mirror** command (Transform menu: Mirror) to make the other half.
4. Change to the **Handle** layer.
5. Use the **Sweep2** command (Surface menu: Sweep 2 Rails) to make the surface using the tang curve as the profile curve.
   A surface is created.

6. Select the surface.
7. Use the **Mirror** command (Transform menu: Mirror) to make the other half.
8. Select both halves.
9. Use the **Join** command (Edit menu: Join) to join the two surfaces.
10 Use the **Cap** command (Solid menu: Cap Planar Holes) to cap the open end.
11 Save your model.

**To create the hole for the handle:**

1 Use the **Circle** command (Curve menu: Circle > Center, Radius) to make a circle 25mm from the end of the handle.
   You may have to draw a construction line to help you position the circle.
2 Use the **Extrude** command (Solid menu: Extrude > Straight) to extrude the curve on both sides of the construction plane.
   Make sure the extrusion intersects both sides of the handle.

![Diagram showing circle and extrusion](image)

3 **Save** your model.
4 Use the **BooleanDifference** command (Solid menu: Difference) to subtract the hole from the handle.
5 Use the **FilletEdge** command (Solid menu: Fillet Edge) to make the fillets at the edges of the hole.
   The edges have rounds on them.

![Diagram showing fillets](image)

6 **Save** your model.
Exercise 61—Creating a squeeze bottle:

Some models require more attention to detail. This is an example of a model that requires precise modeling techniques. This exercise also requires a number of different surface creation techniques.

The technical drawing is included to help you create a very precise model.

1. Start a new model. Use the **Inches.3dm** template.
2. Save as **Bottle**.
3. Make the following layers: **Construction**, **Curve**, **Bottle**, **BottleTop**, **Threads**, **Cap1**, **Cap2**, and **CapTop**.
4. Change to the **Construction** layer.
Create the bottle shape

To create the bottle shape, you will draw curves that defines the bottom and top edge, and then draw a curve that represents the side shape. You will then create a surface from these defining curves.

To draw the construction curves:

1. Use the **Rectangle** command (Curve menu: Rectangle > Corner to Corner) to make rectangles in the Front and Right views that define the overall size of the bottle shape of the bottle. The rectangles will be used as guides for building the bottle curves.

2. Use the **Lock** command (Edit menu: Visibility > Lock) to lock the two rectangles.

3. Use the **Ellipse** command (Curve menu: Ellipse > From Center) to make the shape for the bottom of the bottle.

4. Snap to the intersection of the rectangles for the center of the ellipse.

5. Use the **Move** command (Transform menu: Move) to move the ellipse up .25 in the **Front** view.
6 Use the **Circle** command (Curve menu: Circle > Center, Radius) to draw a circle for the top shape of the bottle.

7 Snap to the intersection at the top of the rectangles for the center of the circle.

**To draw the edge curve:**

1 Change to the **Curve** layer.

2 Use the **Curve** command (Curve menu: Free-Form > Control Points) to define the edge of the bottle in the **Front** viewport.

   Use the rectangle and object snaps to help you establish the correct size. The curve will be used to create the surface of the bottle.
To create the surface for the bottle:

1. Change to the Bottle layer.
2. Use the **Sweep2** command (Surface menu: Sweep 2 Rails) to make the bottle surface. The ellipse and the circle will be the rails. The curve you created will be the shape curve.
3. In the **Sweep 2 Rails Options** dialog box, click **OK**.

Cap the top and bottom

If you close the bottle, thereby creating a solid, Rhino can calculate the bottle’s volume. If you were creating this bottle in real life, knowing the volume would be important. Normally, a bottle would have to be designed to hold a specified volume.

If the edges of the remaining open surfaces are planar curves, you can use the Cap command to close them. The open edges on the bottle are the top circle and the bottom rounded rectangle, and they are planar.

To cap the top and bottom:

1. Select the surface.
2. Use the **Cap** command (Solid menu: Cap Planar Holes) to close the holes.
Flatten the sides

You will notice in the **Right** viewport that the bottle bulges too much. You will create custom surfaces to trim the bulges away.

**To create the trimming surface:**

1. Change to the **Curve** layer.
2. In the **Right** viewport, draw two curves to approximate the shape at the edge of the bottle and the middle of the bottle.
3. The technical drawing gives dimensions for these curves, but for this exercise you can use the construction rectangles to help. If you would like to go further, try to figure out on your own how to draw the curves to the exact specifications.

4. In the **Front** viewport move the curve with more curvature to align with the edge of larger rectangle.

5. **Mirror** the edge curve to the opposite side.
6 Select the three curves you just created.
7 Use the **Loft** command (Surface menu: Loft) to make the cutting surface.
8 In the **Loft Options** dialog box, click **OK**.
   A lofted surface intersects the bottle.
9 **Mirror** the surface to the other side of the bottle.
10 Save your model.

**To remove the surface from the bottle:**
1 Change to the **Bottle** layer.
2 Use the **Dir** command (Analyze menu: Direction) to check the surface normal direction. Flip the normals if necessary.
   The normals should be pointing toward the center of the bottle.
3 Select the bottle.

4 Use the **BooleanDifference** command (Solid menu: Difference) to subtract the two lofted surfaces from the bottle.
   The bottle is now a closed solid.

5 Use the **FilletEdge** command (Solid menu: Fillet Edge) to round off the sharp edges by adding a smooth radius between the edges.
Create the bottle’s top

To create the bottle throat, you are going to revolve a profile curve to create the surface, and then subtract threads.

**To create the profile curve:**

1. Change to the Curve layer.
2. In the Front viewport, use the Lines command (Curve menu: Line > Line Segments) and the Arc command (Curve menu: Arc > Center, Start, Angle) to create a profile curve for the outside and the inside of the top.
3. Use the drawing below to draw the correct dimensions.

- Begin the drawing anywhere in the viewport.
- You will move it to a precise location after it is made.
4. Use the Join command (Edit menu: Join) to join the segments together.
Tip  When drawing line segments, you can use **object snaps**, the **distance constraint**, and **ortho** to draw precisely. For example, for the first line type .5,7.25 for the starting point, then simply type .25 to constrain the line to .25 units. Turn Ortho on and drag the line to the right and click. The line stops at .25 units from the beginning of the line. For the vertical line on the left, use the End object snap to pick the end of the first line, type .375 to constrain the distance, and drag the line up.

6  Use the **Move** command (Transform menu: Move) to move the profile from the midpoint of the bottom edge to the quadrant of the top of the bottle.

7  Change to the **Bottle Top** layer.

**To create the top surface:**

1  Select the profile curve.

2  Use the **Revolve** command (Surface menu: Revolve) to make the surface.

3  In the **Revolve Options** dialog box, click **Delete curve to revolve**, and click **OK**. The top is created.

**Note:** Practice additional surface modeling techniques by creating threads on the bottle top and the caps for the model. Use the technical drawing to help.
Adding the threads
To add the threads, you will sweep a profile shape along a path drawn with the Helix command.

To create the path curve helix:
1. Change to the Curve layer.
2. From the Curve menu, click Helix.
3. At the Start of axis (Vertical AroundCurve) prompt, snap to the center point at the bottom of the area to be threaded.
4. At the End of axis prompt, snap to the center at the top of the area to be threaded.
5. At the Radius and start point <1.000> (Diameter Mode=Pitch Turns=1.25 Pitch=0.25 ReverseTwist=No) prompt, click Turns.
6. At the Number of turns <1.250> prompt, type 1.5 and press Enter.
7. At the Radius and start point <1.000> ... prompt, pick a point near the edge that is slightly smaller than the outside edge of the area to be threaded.
To draw the thread profile:

1. Draw a triangle using the **Polygon** command for the thread as shown below.

2. Select the triangle you created.

3. From the **Transform** menu, click **Array**, and then click **Along Curve**.

4. At the **Select path curve** (Basepoint) prompt, select the helix near the bottom.

5. In the **Array Along Curve Options** dialog, change the number of items to **5** and click **Roadlike**.

6. At the **Click in a viewport to choose a CPlane** prompt, click in the **Top** viewport.

   It might be a good idea at this point to change your perspective view so you can see the profile curves more easily.
Delete the first and last profile curve. You will use the remaining profile curves to create a surface.

To create the thread surface:

1. Change to the BottleTop layer. You can see the helix and profile curves easier if you Hide the bottle top at this point. Use the Sweep1 command to create a surface that starts a point at one end of the helix, goes through each profile, and ends at a point at the other end of the helix.

2. From the Surface menu, click Sweep 1 Rail.

3. At the Select rail curve prompt, select the helix.

4. To start the surface at a point, at the Select cross-section curves (Point) prompt, type P, and press Enter.

5. At the Pick start point prompt, use the End object snap to pick one end of the helix.

6. At the Select cross-section curves (Point) prompt, select the profile curves in order.

7. To end the surface at a point, at the Select cross-section curves (Point) prompt, type P, and press Enter.
8 At the **Pick end point** prompt, use the **End** object snap to pick the other end of the helix.

![Perspective view of a helix](image)

9 At the **Adjust curve seams (Flip Automatic Natural)** prompt, press **Enter**.

10 In the **Sweep 1 Rail Options** dialog box, change the **Style** to **Roadlike Top**, and click **OK**.

![Sweep 1 Rail Options dialog box](image)

11 **Show** the bottle top.

![Perspective view of the bottle top](image)

12 Select the helical thread and the bottle top.

13 Use the **BooleanUnion** command (Solid menu: Union) to join the thread and the bottle top.

![Perspective view of the joined components](image)
Importing and Exporting Models

Rhino supports many different import and export formats, making it possible to model in Rhino and then export your model to downstream processes. For a complete list of import and export options refer to Rhino Help. Search the index for “import and export.”

Importing and Exporting Rhino File Information

When you export to a format like 3DS, STL or DWG, Rhino has to convert from smooth NURBS surfaces to a polygon mesh representation made of triangles. To do a good approximation of the curved surfaces, Rhino can sometimes use a lot of polygons. The density of triangles can be adjusted when exporting. You can create a mesh object and export it, or Rhino can create the mesh during the export process.

There are two methods to export models to other formats. You can “Save As” and choose a specific export format to export an entire model. You can select some objects and “Export Selected” then choose a specific export format to export a portion of the model. In the following exercise you will use the “Save As” method to export three of the most common file formats.

Exercise 62—Exporting models

To export a model to a mesh format:

1. **Open** the model **Export.3dm**.
2. From the **File** menu, click **Save As**.
3. In the **Save As** dialog box, change the **Save as type** to **Stereolithography (*.stl)**.

4. In the file name box type **Export** and click **Save**.

5. In the **STL Export Options** dialog box, click **Binary**, check **Export open objects** and click **OK**.

6. In the **Polygon Mesh Options** dialog box, click **Preview**.

*Notes:*

- Flat shade of the render mesh.
7 Adjust the slider to the left for Fewer polygons and click Preview.

![Image of a slider with Fewer polygons and Preview button highlighted.]

**Flat shade of the mesh.**

8 Move slider all the way to the left and Preview.

![Image of a slider with Fewer polygons and Preview button highlighted.]

**Flat shade of the mesh.**

9 Adjust the slider until you get the desired mesh, then click OK.

Detailed mesh controls are discussed in more depth in the Level 2 training class.
To export a model to IGES:

1. From the **File** menu, click **Save As**.
2. In the **Save As dialog** box, change the **Save as type** to **IGES (*.igs)**.
3. In the **IGES Export Options** dialog box, select **Pro E Windows solids** as the IGES type, click **Detailed Controls**.
   
   Detailed controls allows the user more input.

4. Click **Cancel** to terminate, or **OK** to create the IGES file.

To export a model to STEP:

1. From the **File** menu, click **Save As**.
2. In the **Save As dialog** box, change the **Save as type** to **STEP (*.stp, *.step)**.
3. In the **STEP Options** dialog box, use the default setting.
Rendering is available for showing your model as if it was photographed. While the Rhino renderer may be good enough for much of your work, use another rendering program such as Rhino’s Flamingo plug-in for higher quality results. Flamingo is available as a plug-in to Rhino 2.0. Visit www.flamingo3d.com for more information.

Rhino’s renderer uses color, spotlights, displays shadows, and does antialiasing. It also allows the attachment of textures and bump maps. In this exercise we will focus on the full rendering capability.

**Exercise 63— Practice rendering a model**

1. **Open** the model **Render.3dm**.
2. From the **Render** menu, click **Current Renderer**, then click **Rhino Render**.
3. Right click on the **Perspective** title bar, then click **Rendered display**.
   The viewport mimics but does not exactly duplicate what you will get in a Render.
To assign a color to the handle:

1. In the **Layers** dialog box, click on the **Materials** column for the **Handle** layer.

2. In the **Material** dialog box, click **Basic**.
   
   To give the handle a highlight, change the Reflective finish setting.
   
   A highlight of 0 means that the object is not shiny at all and it will not have a specular highlight. A low value of highlight makes the shiny spot to be small, and the object will look glossier. As the highlight increases in value, the shiny spot gets large—this makes the object look more like it is made out of a reflective material.
   
   The shiny spot only appears when you are looking at an object at a certain angle relative to the angle of the light.

3. Change the **Reflective finish** setting to **90**, then click the **Color** swatch.
4 In the Select Color dialog box, select a color, like **Red**, and click **OK**.

![Select Color dialog box](image)

5 Repeat the steps above to assign a material to the Blade layer.

6 From the **Render** menu, click **Render**.

A display window appears with the current viewport rendered in colors, but it will probably lack detail. You can close the Display Window without disturbing your model. Placing lights will add depth and detail to the rendered image.

![Blade layer](image)
To place a light:
Start with a standard lighting scheme. You can experiment to develop your own lighting schemes later.

1. **Zoom** out in the **Top** and the **Front** viewport.
2. Change to the **Lights** layer.
3. From the **Render** menu, click **Create Spotlight**.
4. At the **Base of cone** (Vertical Diameter 3Point Tangent AroundCurve) prompt, pick a point near the center of the screwdriver and slightly above it in the **Front** viewport.

5. At the **Radius <1>** (Diameter) prompt, pick a point so that the radius is larger than the entire screwdriver in the **Top** viewport.

6. At the **End of cone** prompt, hold down the control key, and pick a point below and to the left in the **Top** viewport.
This starts elevator mode.
7 At the **End of cone** prompt, click above the object in the **Front** viewport. This will be your main light.

8 Click in the **Perspective** viewport.

9 From the **Render** menu, click **Render**. The image has some highlights and shadows.

**To place a second light:**

1 Zoom out in the **Top** and the **Front** viewport.

2 From the **Render** menu, click **Create Spotlight**.

3 At the **Base of cone (Vertical)** prompt, pick a point to the right and slightly below the screwdriver and covers about half of it in the **Top** viewport.

4 At the **Radius <1> (Diameter)** prompt, pick a point so that the radius is larger than the entire screwdriver in the **Top** viewport.
5 At the **End of cone** prompt, click to the right and slightly below the object in the **Top** viewport. This will be your secondary (fill) light.

![Top View](image)

**To assign properties to the light:**

1. Select the new light.
2. From the **Edit** menu, click **Object Properties**.
3. On the **Light** page, change the **Shadow intensity** to 30 and the **Spotlight hardness** to 60. Experiment with these settings to get the desired effect.

![Light Properties](image)

4. Click in the **Perspective** viewport.
5. From the **Render** menu, click **Render**.
To add a bumpy surface to the handle:

1. In the **Layers** dialog box, click on the **Materials** column for the **Handle** layer.

2. In the **Material** dialog box, click the **Bump** button.

   ![Material dialog box]

   You can use any bitmap file for a bump. The bumps come from the pattern of light and dark in the bitmap image.

3. In the **Open Bitmap File** dialog box, select **Pattern.jpg**, then click **Open**.
4. Click **OK** to close the **Material** dialog box.
5 From the **Render** menu, click **Render**.
   The surface of the handle has a bumpy appearance.

   ![Image of a handle]

   **To add a texture to the handle:**
   1 In the **Layers** dialog box, click on the **Materials** column for the **Handle** layer.
   2 In the **Material** dialog box, clear the **Bump** field.
   3 In the **Material** dialog box, click the **Texture** button.
   ![Material dialog box with Wood.jpg selected]
   4 In the **Open Bitmap File** dialog box, select **Wood.jpg**, then click **Open**.
   5 Click **OK** to close the **Material** dialog box.
6 From the **Render** menu, click **Render**.
   
The surface of the handle is textured with a wood grain texture.

**To make the handle transparent:**
1 In the **Layers** dialog box, click on the **Materials** column for the **Handle** layer.
2 In the **Material** dialog box, clear the **Texture** field.
3 In the **Material** dialog box, change the **Transparency** setting to **50**.
4 From the Render menu, click Render. The handle will look transparent.

To add a surface for a ground plane:

1 Use the Plane command (Surface menu: Plane > Corner to Corner) to draw a flat surface in the Top viewport.

2 Select the surface.

3 Use the Properties command (Edit menu: Object Properties...) on the Material page, click Basic.
4 In the **Texture** section assign the **Wood.jpg** to the plane.

5 From the **Render** menu, click **Render**.

### Rendering with Flamingo

In this part of the exercise you will use Flamingo to assign materials from the material library and set up an environment. You will use the same lights and model.

**To assign a material:**

1. Select the flat surface.
2. Use the **Hide** command (Edit menu: Visibility > Hide) to hide it.
3. From the **Render** menu, click **Current Renderer**, then click **Flamingo Raytrace**.
4. In the **Layers** dialog box, click on the **Materials** column for the **Handle** layer.
5. In the **Material** dialog box, click **Plug-in**, then click **Browse**.
6. In the **Material Library** dialog box, in the **Plastics** library, in the **Transparent** folder, select a material, then press **OK**.
7. In the **Material** dialog box, press **OK**.
8. Repeat this process for the **Blade** layer.
9. Choose a shiny metal material, like **Metal\Steel\Polished\Plain**.
10 **Render** the model.

**To set up an environment:**

1. Use the **Options** command (Tools menu: Options...) to setup the Flamingo environment options.
2. In the **Rhino Options** dialog box, on the Flamingo page, click the **Environment** button.
3. On the **Environment** dialog box, change to a **3 Color Gradient**.
   - Use the default setting.
4. Check the **Ground Plane** check box.
5. On the **Ground Plane** page, click the **Material** button, and select a material for the ground plane, like **Metal\Aluminum\Satin\Checker Plate**.
6. On the **Environment** dialog box, press **OK**.
7. On the **Rhino Options** dialog box, press **OK**.
8. **Render** the model.
   - Notice that you also get reflections.

Flamingo rendering is covered in more depth in Level 2 training.
For extra practice use the canoe you made in the loft exercise.
# Dimensions

You can create simple dimensions that are visible when you are looking at the plan view of the construction plane.

## Dimension Types

<table>
<thead>
<tr>
<th>Button</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Dim]</td>
<td>Dim</td>
<td>Creates a horizontal or a vertical dimension.</td>
</tr>
<tr>
<td>![DimAligned]</td>
<td>DimAligned</td>
<td>Creates an aligned dimension.</td>
</tr>
<tr>
<td>![DimRotated]</td>
<td>DimRotated</td>
<td>Creates a rotated dimension.</td>
</tr>
<tr>
<td>Button</td>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>--------</td>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td></td>
<td>DimAngle</td>
<td>Creates an angular dimension.</td>
</tr>
<tr>
<td></td>
<td>DimRadius</td>
<td>Creates a radius dimension.</td>
</tr>
<tr>
<td></td>
<td>DimDiameter</td>
<td>Creates a diameter dimension.</td>
</tr>
<tr>
<td>TEXT</td>
<td>Text</td>
<td>Creates 2-D annotation text.</td>
</tr>
<tr>
<td></td>
<td>Leader</td>
<td>Draw an arrow leader.</td>
</tr>
<tr>
<td></td>
<td>Properties</td>
<td>Edit dimensions and text.</td>
</tr>
<tr>
<td></td>
<td>DimRecenterText</td>
<td>Returns text that has been moved away from its default position to its original location.</td>
</tr>
<tr>
<td></td>
<td>Make2-D</td>
<td>Creates curves from the selected objects as silhouettes relative to the active construction plane. The silhouette curves are projected flat and then placed on the world x,y-plane.</td>
</tr>
</tbody>
</table>

**Exercise 64— Practice dimensioning**

1. Open the model **Dimension.3dm**.
2. From the **File** menu, click **Properties**.
3. In the **Rhino Options** dialog box, on the **Dimensions** page, make the following changes.

![Rhino Options dialog box](image)

4. From the **Dimension** menu, click **Linear Dimension**.

5. At the **First dimension point** (Style) prompt, snap to the lower left end of the part in the **Top** viewport.

6. At the **Second dimension point** prompt, snap to the lower right end of the part in the **Top** viewport.

7. At the **Dimension location** (Vertical Horizontal) prompt, pick a point below the part in the **Top** viewport.

8. **Use object snaps to locate the extension line origins.**
8 From the **Dimension** menu, click **Radial Dimension**.

9 At the **Select curve for radius dimension** (Style) prompt, select the lower left quadrant of the arc in the **Front** viewport.

10 At the **Dimension location** prompt, click to place the dimension text.

11 Dimension the rest of the drawing using leaders, text blocks, horizontal, vertical, radius, and diameter dimensions.

12 **Save** your model.

**Making a 2-D Drawing from a 3-D Model**

Rhino has the ability to generate a two-dimensional drawing from a three-dimensional model, by projecting the geometry to the world coordinate plane, and aligning the views. Options for first angle projection or third angle projection are available. In addition to the three orthographic views, a two-dimensional perspective drawing is also generated. Hidden lines are removed and placed on a separate layer.

Options for creating four views: three parallel viewports and a perspective viewport, or single views of individual viewports are supported.

The Make2D command makes a two-dimensional drawing for all four views.
Exercise 65—Practice making a 2-D drawing for export

1. Open the model Make2D.3dm.
2. From the Dimension menu, click Make 2-D Drawing.
3. In the Make2D Options dialog box, click 4-view (USA) and check Show hidden lines, and then click OK.

The 2-D drawings are created on the Top CPlane near the origin on the world xy plane. View them in the Top viewport.

4. Dimension the 2D drawing.
To export the 2-D drawing to AutoCAD:

1. Select the 2-D geometry and the dimensions.
2. From the File menu, click Export Selected.
3. Change the Save as type to AutoCAD DWG, the File name to Bracket.dwg, then click Save.
4. In the AutoCAD Export Options dialog box, AutoCAD Version 2000, Save Curves as Polylines, Save Surfaces as Polygon meshes, Save Polygon meshes as Polyface meshes, check Use Simple Entities, click OK.

The 2-D geometry, layers and dimensions are translated to AutoCAD’s .DWG format.
Printing a wireframe image of your model directly from Rhino is supported. Options for scaling and printing in color are available. Images in the current viewport or all viewports can be printed. Rhino uses your windows printing device for output. While printing to scale is supported, hidden line removal is not supported. Use the Make2D command to generate hidden-line views to print.

**Exercise 66— Practice printing**

1. **Open** the model **Printing.3dm**.
2. **Click in the Top viewport.**
3. **From the File menu, click Print Setup.**
4. **In the Print Setup dialog box, click Landscape, adjust any other options appropriate for your printer or plotter, then click OK.**
5. **From the File menu, click Print.**
6 In the **Print** dialog box, choose the following settings:
   Under **Print area**, click **View**.
   Under **Print scale**, select **Scaled to Fit**.
   Under **Print offset** click **Center objects on paper**.
7 Click **OK**.

The **Top** viewport will be printed.
To print the current viewport to a scale:
1. From the File menu, click Print.
2. In the Print dialog box, change Print scale to 1:20, then click OK.

To print a rendered image:
1. Open the model Render.3dm.
2. From the Render menu, click Render.
3. In the render window, from the File menu, click Print.
   The rendered image will be printed to your default Windows printing device, which may be different from what you set in Print Setup.
Part Four:
Customizing Workspaces and Toolbars
Rhino Settings

Options

The Rhino Options dialog box displays most of the settings that affect your modeling environment. Use it to toggle the settings or redefine them.

The Document Properties settings are saved with the Rhino model. The Rhino Options settings are saved in the Windows registry and affect every Rhino model.

Exercise 67—Practice with options

To change modeling aids:

1. From the Tools menu, click Options.
2. In the Rhino Options dialog box, click the Modeling Aids page.
   - The Modeling Aids page controls Grid Snap, Ortho, Planar mode, and Object Snap options.
   - These options can be toggled on and off from the dialog box or from the status bar. To change the options for Ortho or object snap, type new values in the boxes. In an earlier exercise you changed the Ortho setting so that it snapped every 30 degrees.

   In the object snap area, Project object snap to CPlane projects the snap point to the construction plane even though the object snap point might be in 3-D space.

To change Rhino’s screen appearance:

1. Click the Appearance page.
   - The Appearance page controls the appearance of the Rhino window.
2. Click the gray rectangle next to **Background color** and change it to a different color.
3. Check the **Crosshairs** box.
To change or create shortcuts:

1. Open the Keyboard page.
   The Keyboard page sets up shortcut keys for Rhino commands.

2. Type DisableOsnap in the box next to the F4 key.
   This gives you a key that toggles your persistent object snaps between on and disabled.
To change or create command aliases:

1. Click the **Aliases** page.
   
   The command Aliases page allows the user to create custom aliases for Rhino commands.

2. Click **New**.
   
   A cursor moves into the white area of the dialog box.

3. Type **L**, then press the tab key.

4. Type **! Lines**.
   
   The exclamation point acts as a cancel.

   Now you will be able to type **L** and press **Enter** at the command line, to begin the **Lines** command.

To change view options:

Click the **View** page.

The View page has pan, zoom, rotate, and redraw controls.
To change general options:
Click the General page.

The General page the number of undos retained in memory, startup commands, recent command list limit, AutoSave control, and do not repeat commands, default isocurve density for new surfaces.

To set file options:
1. Click the Files page.
The Files page sets the location of template files and the autosave files.
2. Click OK to close the Options dialog box.
3. Try the Lines alias and the DisableOsnap toggle.
   Note how your cursor has changed.

Document Properties
Document properties are all of the settings that are saved with the Rhino model.

Exercise 68—Practice with document properties

To change the grid:
1. From the File menu, click Properties.
2. Click the Grid page.
The Grid page configures grid, grid axes, and axis icons. You changed the snap spacing in an earlier exercise.

To change render options:
1. Click the Rhino Render or Flamingo page.
The Render page controls most of the render options.
2. Click the Mesh page.
   This page controls the mesh properties. It will also affect performance.

To set units:
Click the Units page.
The Units page controls the unit system and the tolerance settings.
15

Custom Toolbar Layouts

The toolbar layout is the arrangement of toolbars containing command buttons on the screen. The toolbar layout is stored in a toolbar collection file that you can open and save. Rhino comes with a default toolbar layout, and automatically saves the active toolbar layout before closing. You can create your own custom layouts and save them for later use.

You must use an external file manager to delete a toolbar collection file.

**Exercise 69— Customizing a toolbar layout**

1. Begin a new model.
2. From the **Tools** menu, click **Toolbar Layout**.
3. In the **Toolbars** dialog box, click **Save As**.
4. In the **Save Workspace As** dialog box, in the **File name** box type **Level 1**, and click **Save**.

   A new toolbar collection file has been created. Toolbar collection files are saved with a .ws3 extension. You will use this new toolbar collection to do some customization.
To show another toolbar:

1. From the Tools menu, click Toolbar Layout.

2. In the Toolbars dialog box, check Curve Tools to show the toolbar.

3. In the Toolbars dialog box, clear Curve Tools to hide the toolbar.

4. Show the Curve Tools toolbar again, then click Close.
5 To dock the **Curve Tools** toolbar at the right, drag it to the right edge until it changes to a vertical shape, then releasing your mouse button.

**To save your toolbar layout:**

In the **Toolbars** dialog box, from the **File** menu, click **Save**.
To create a new toolbar:

1. From the **Tools** menu, click **Toolbar Layout**.
2. In the **Toolbars** dialog box, from the **Toolbar** menu, click **New**.
3. In the **Toolbar Properties** dialog box, in the **Name** box, type **Test**, and click **OK**.
   
   A new toolbar is created with one blank button in it.

4. Close the **Toolbars** dialog box.

**To edit the new button:**

1. Hold down the **Shift** key and right-click the blank button.

2. To enter the tooltips for the left and right mouse buttons, in the **Edit Button** dialog box, under **Tooltips**, in the **Left** edit box, type **Change Last Object to Layer**.
   
   In the **Right** edit box, type **Change All Curves to Layer**.
3 In the **Left mouse button command** box, type `! SelLast ChangeLayer`.

4 In the **Edit Button** dialog box, in the **Right mouse button command** box, type `! SelCrv ChangeLayer`.

5 Click **Edit Bitmap**.

6 In the **Edit Bitmap** dialog box, make a picture for the button face image, and click **OK**.

7 In the **Edit Button** dialog box, click **OK**.
To copy a button from one toolbar to another:
1. From the **Standard** toolbar, flyout the **Layer** toolbar, and tear it off.
2. While holding down the **Ctrl** key, drag the button you just created to the layer toolbar and drop it.

![Layer toolbar]

To add a button to a toolbar:
1. From the **Tools** menu, click **Toolbar Layout**.
2. In the **Toolbar** dialog box, check the **Test** toolbar in the list to show the toolbar.
3. Click **New Button**.
   A blank button is added to the **Test** toolbar.
4. **Close** the dialog box.
   Many toolbar functions are available by right-clicking a toolbar’s titlebar.
To open the standard toolbar layout:
1. From the Tools menu, click Toolbar Layout.
2. In the Toolbars dialog box, from the File menu, click Close.
3. In the Save Changes dialog box, click Yes.
4. In the Toolbars dialog box, from the File menu, click Open.
5. Select Default.ws3, and click Open.
